

**Some Groups  
Whose Boundaries  
Are Spheres**

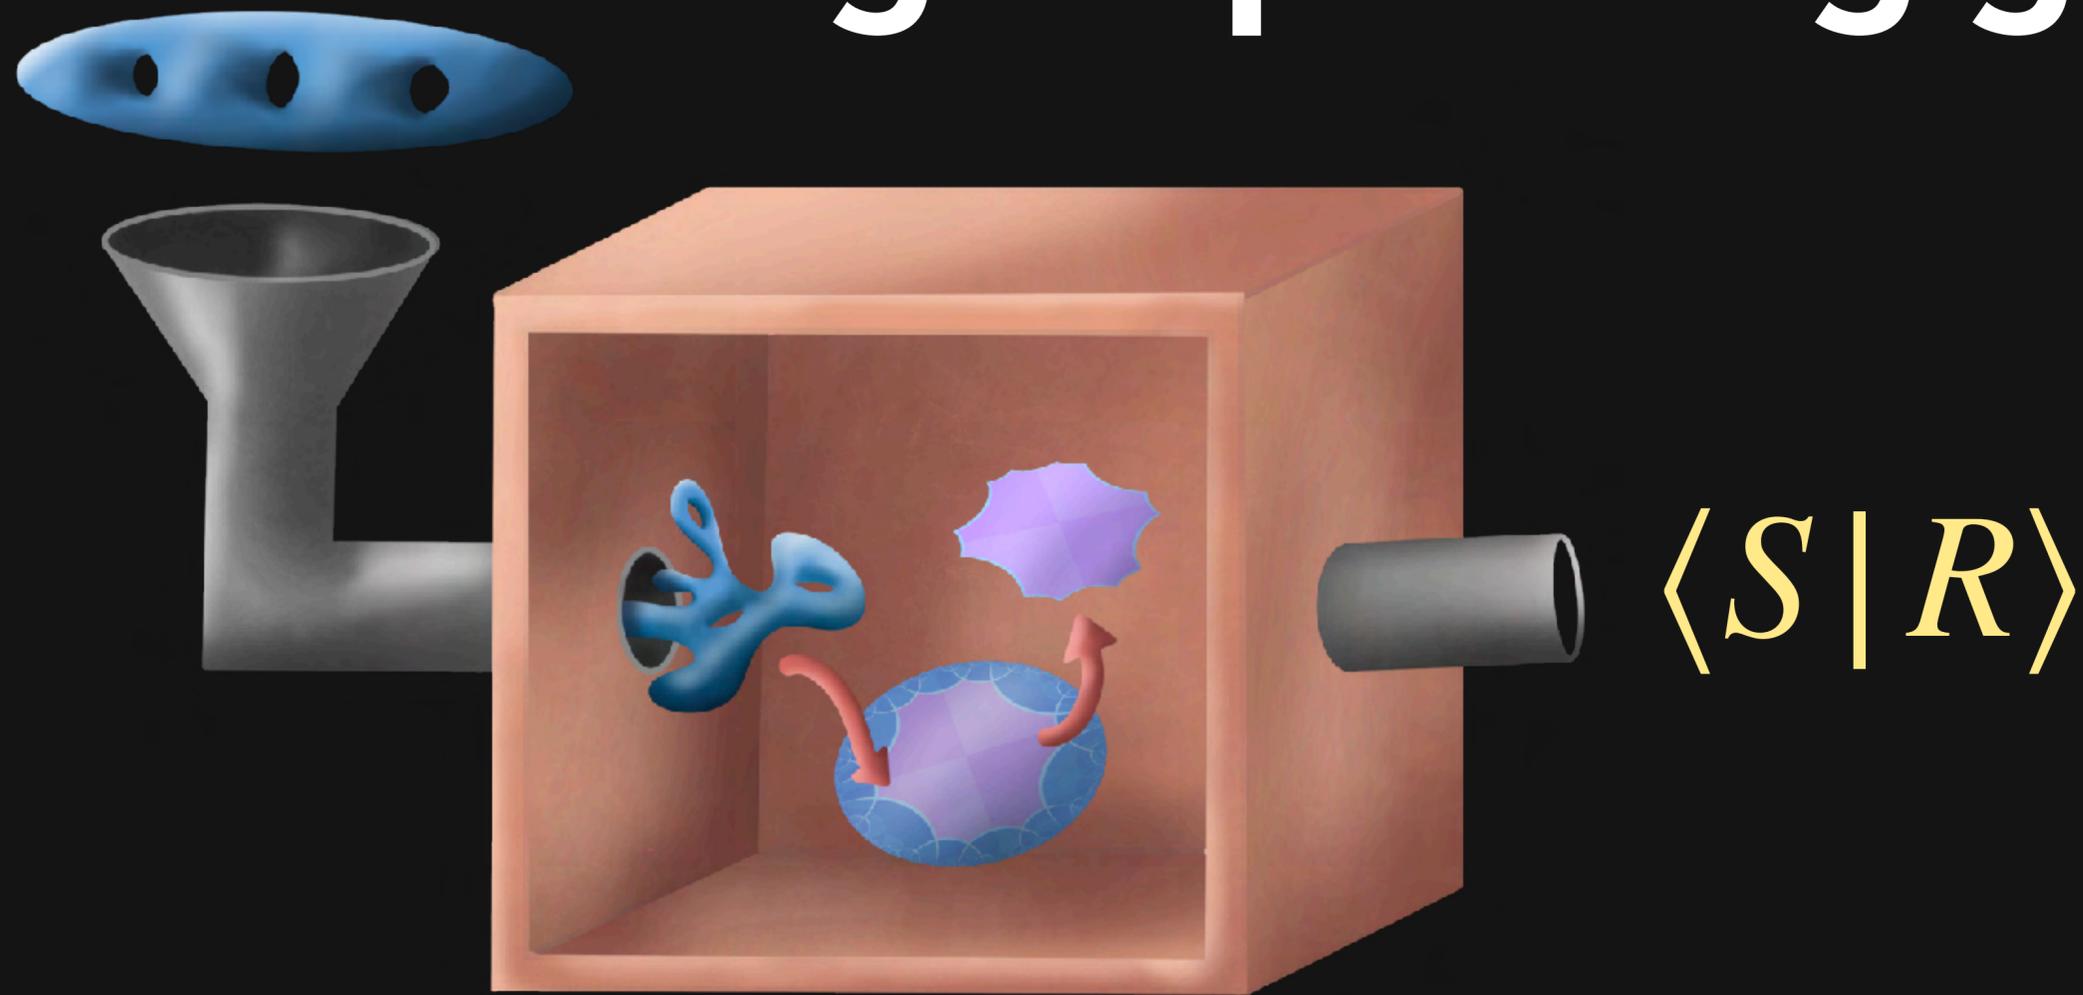

**(Or....an excuse to talk about  
hyperbolic Dehn surgery)**

# Geometrizing a group to study it.

$\langle S | R \rangle$

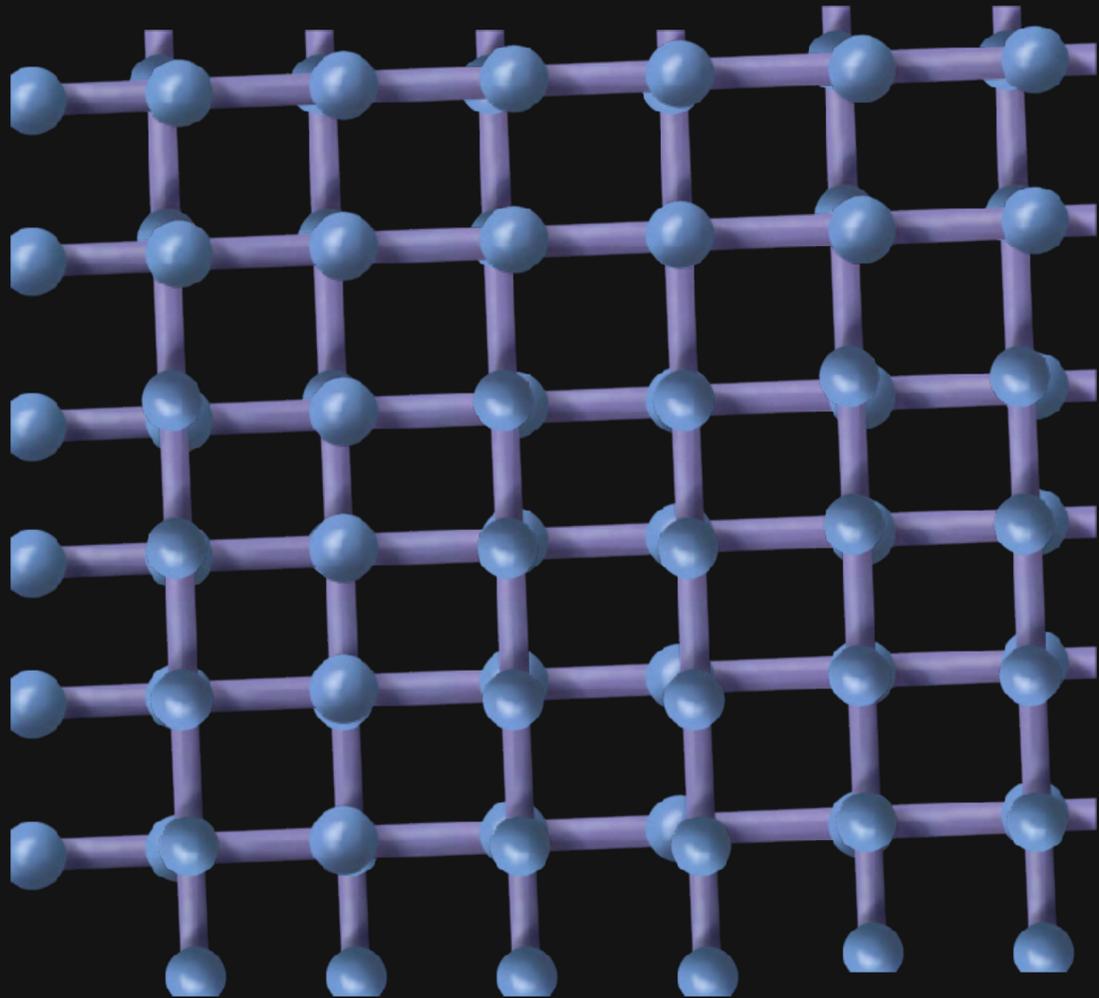

# Producing examples of groups using geometry.

# Milnor-Švac

**If a group  $G$  acts properly discontinuously and cocompactly on a space  $X$ , then  $G$  is quasi-isometric to  $X$ .**

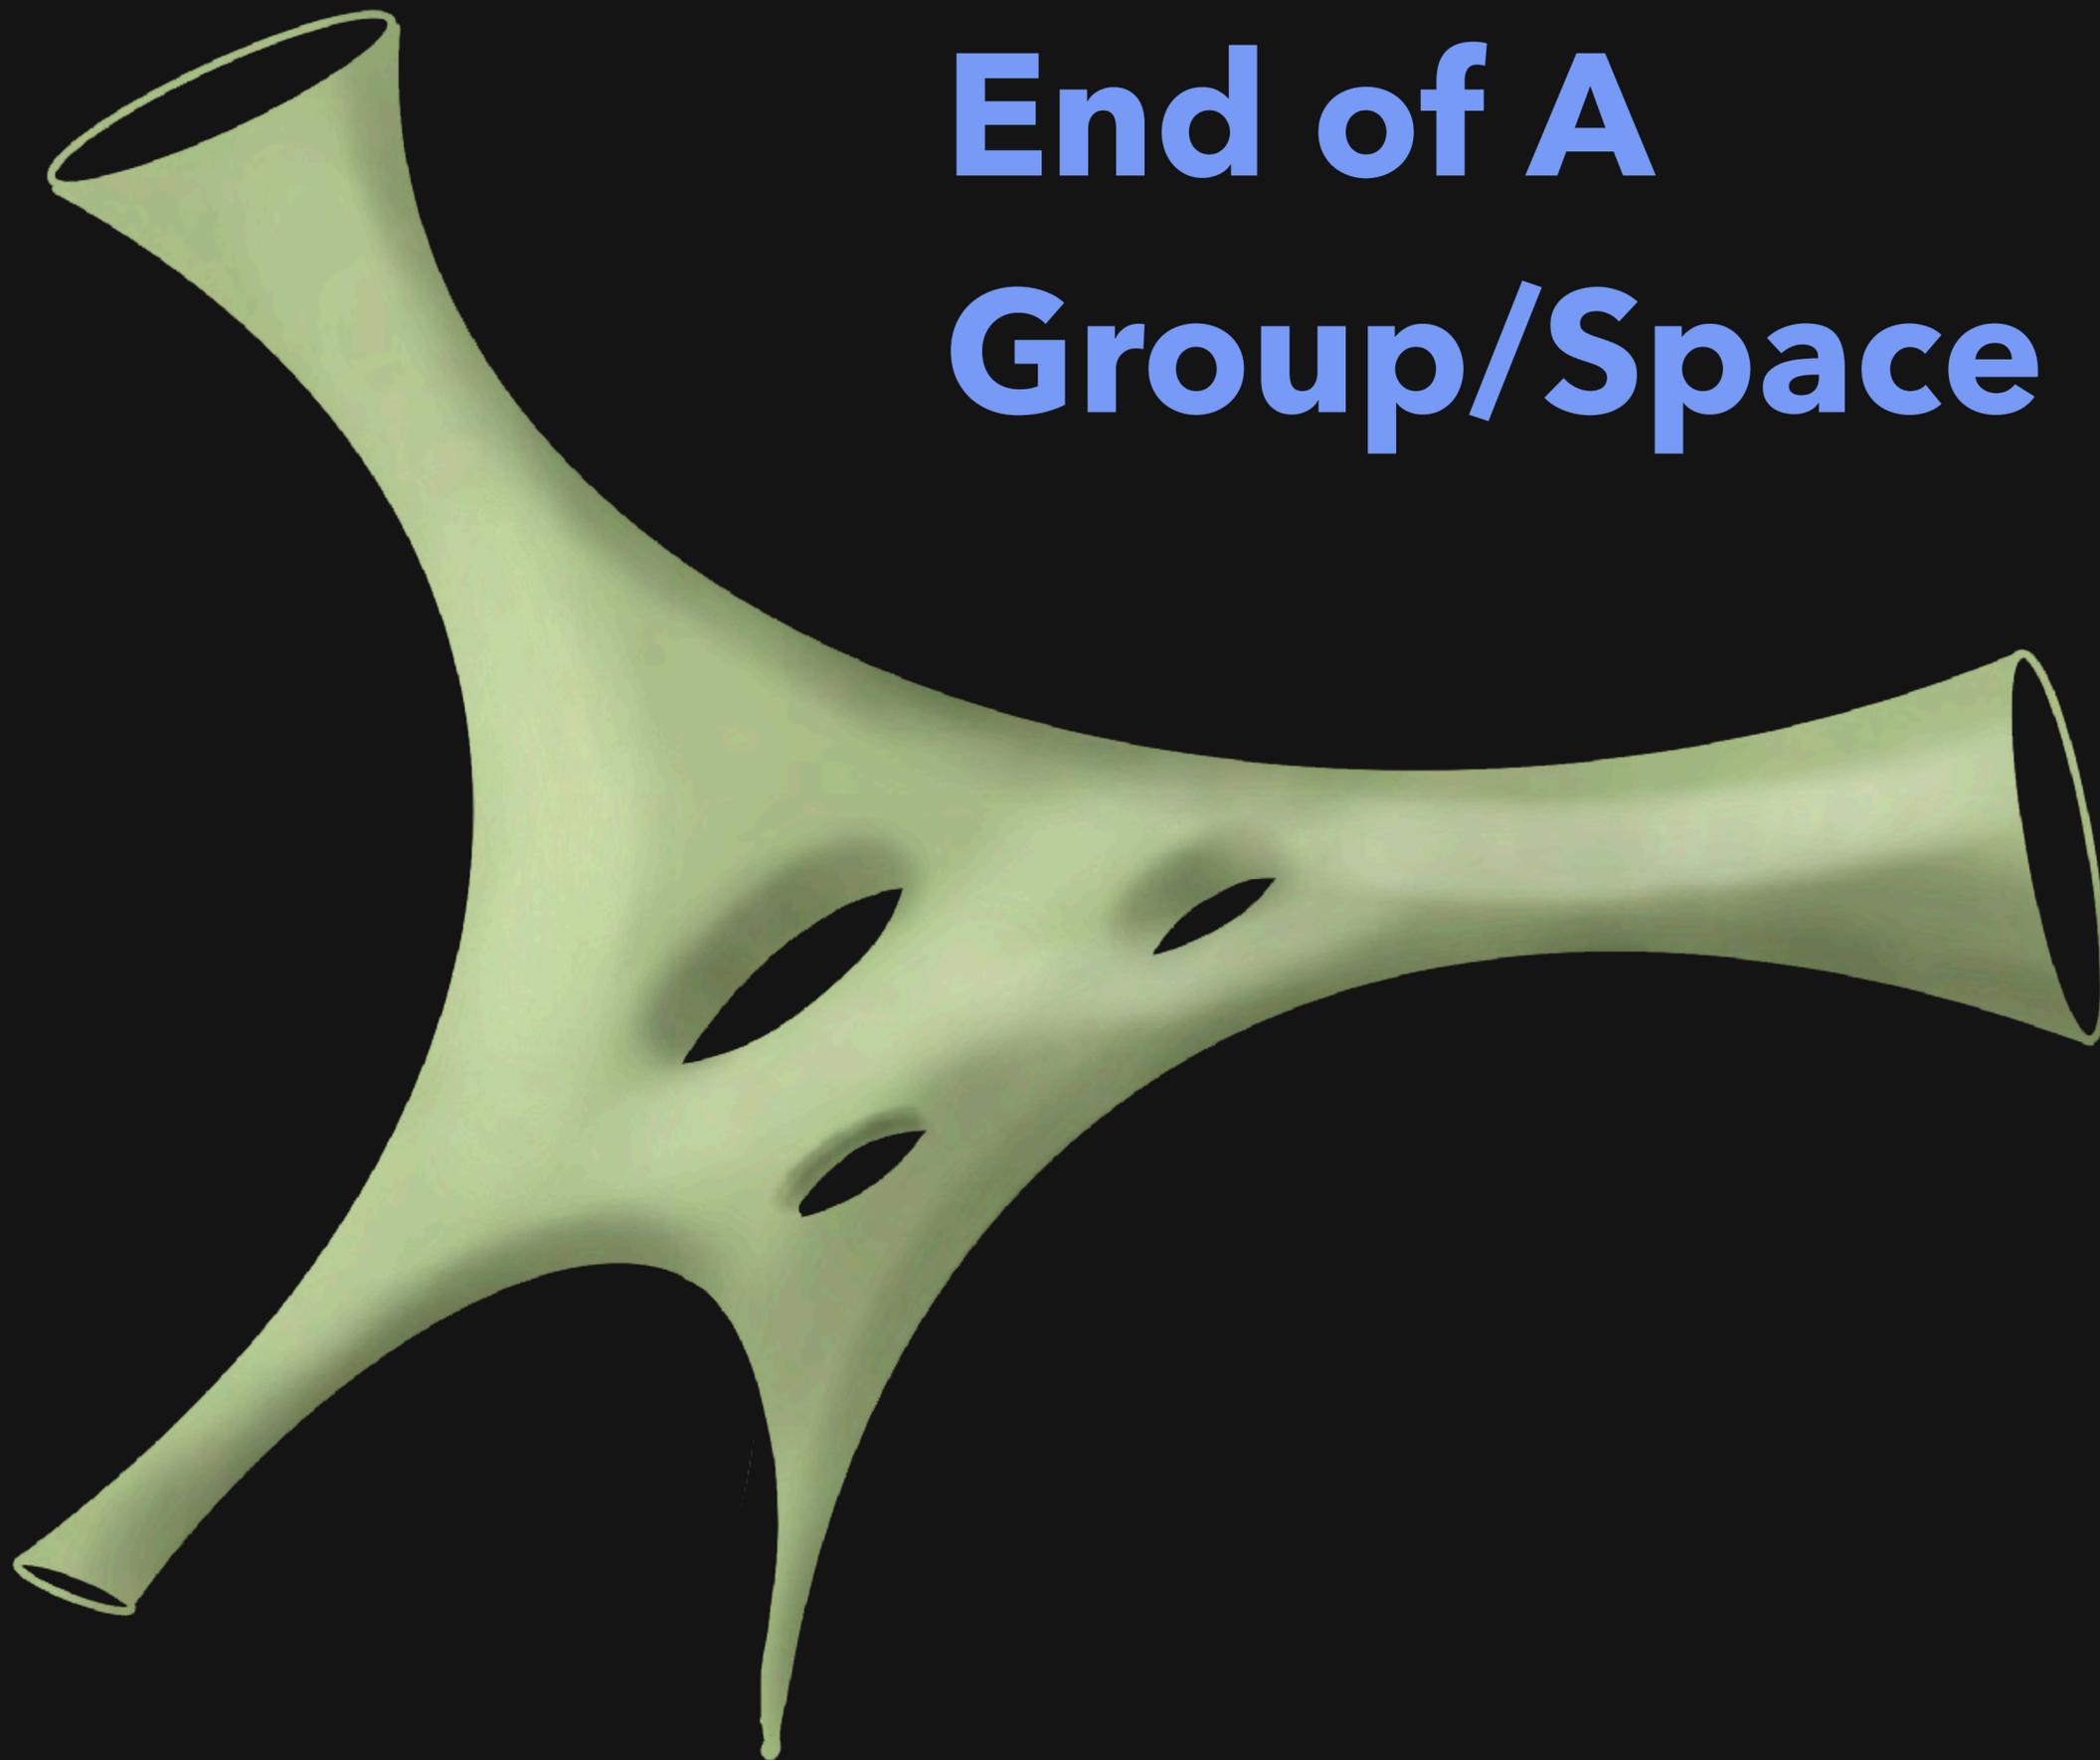

# Quasi-Isometry

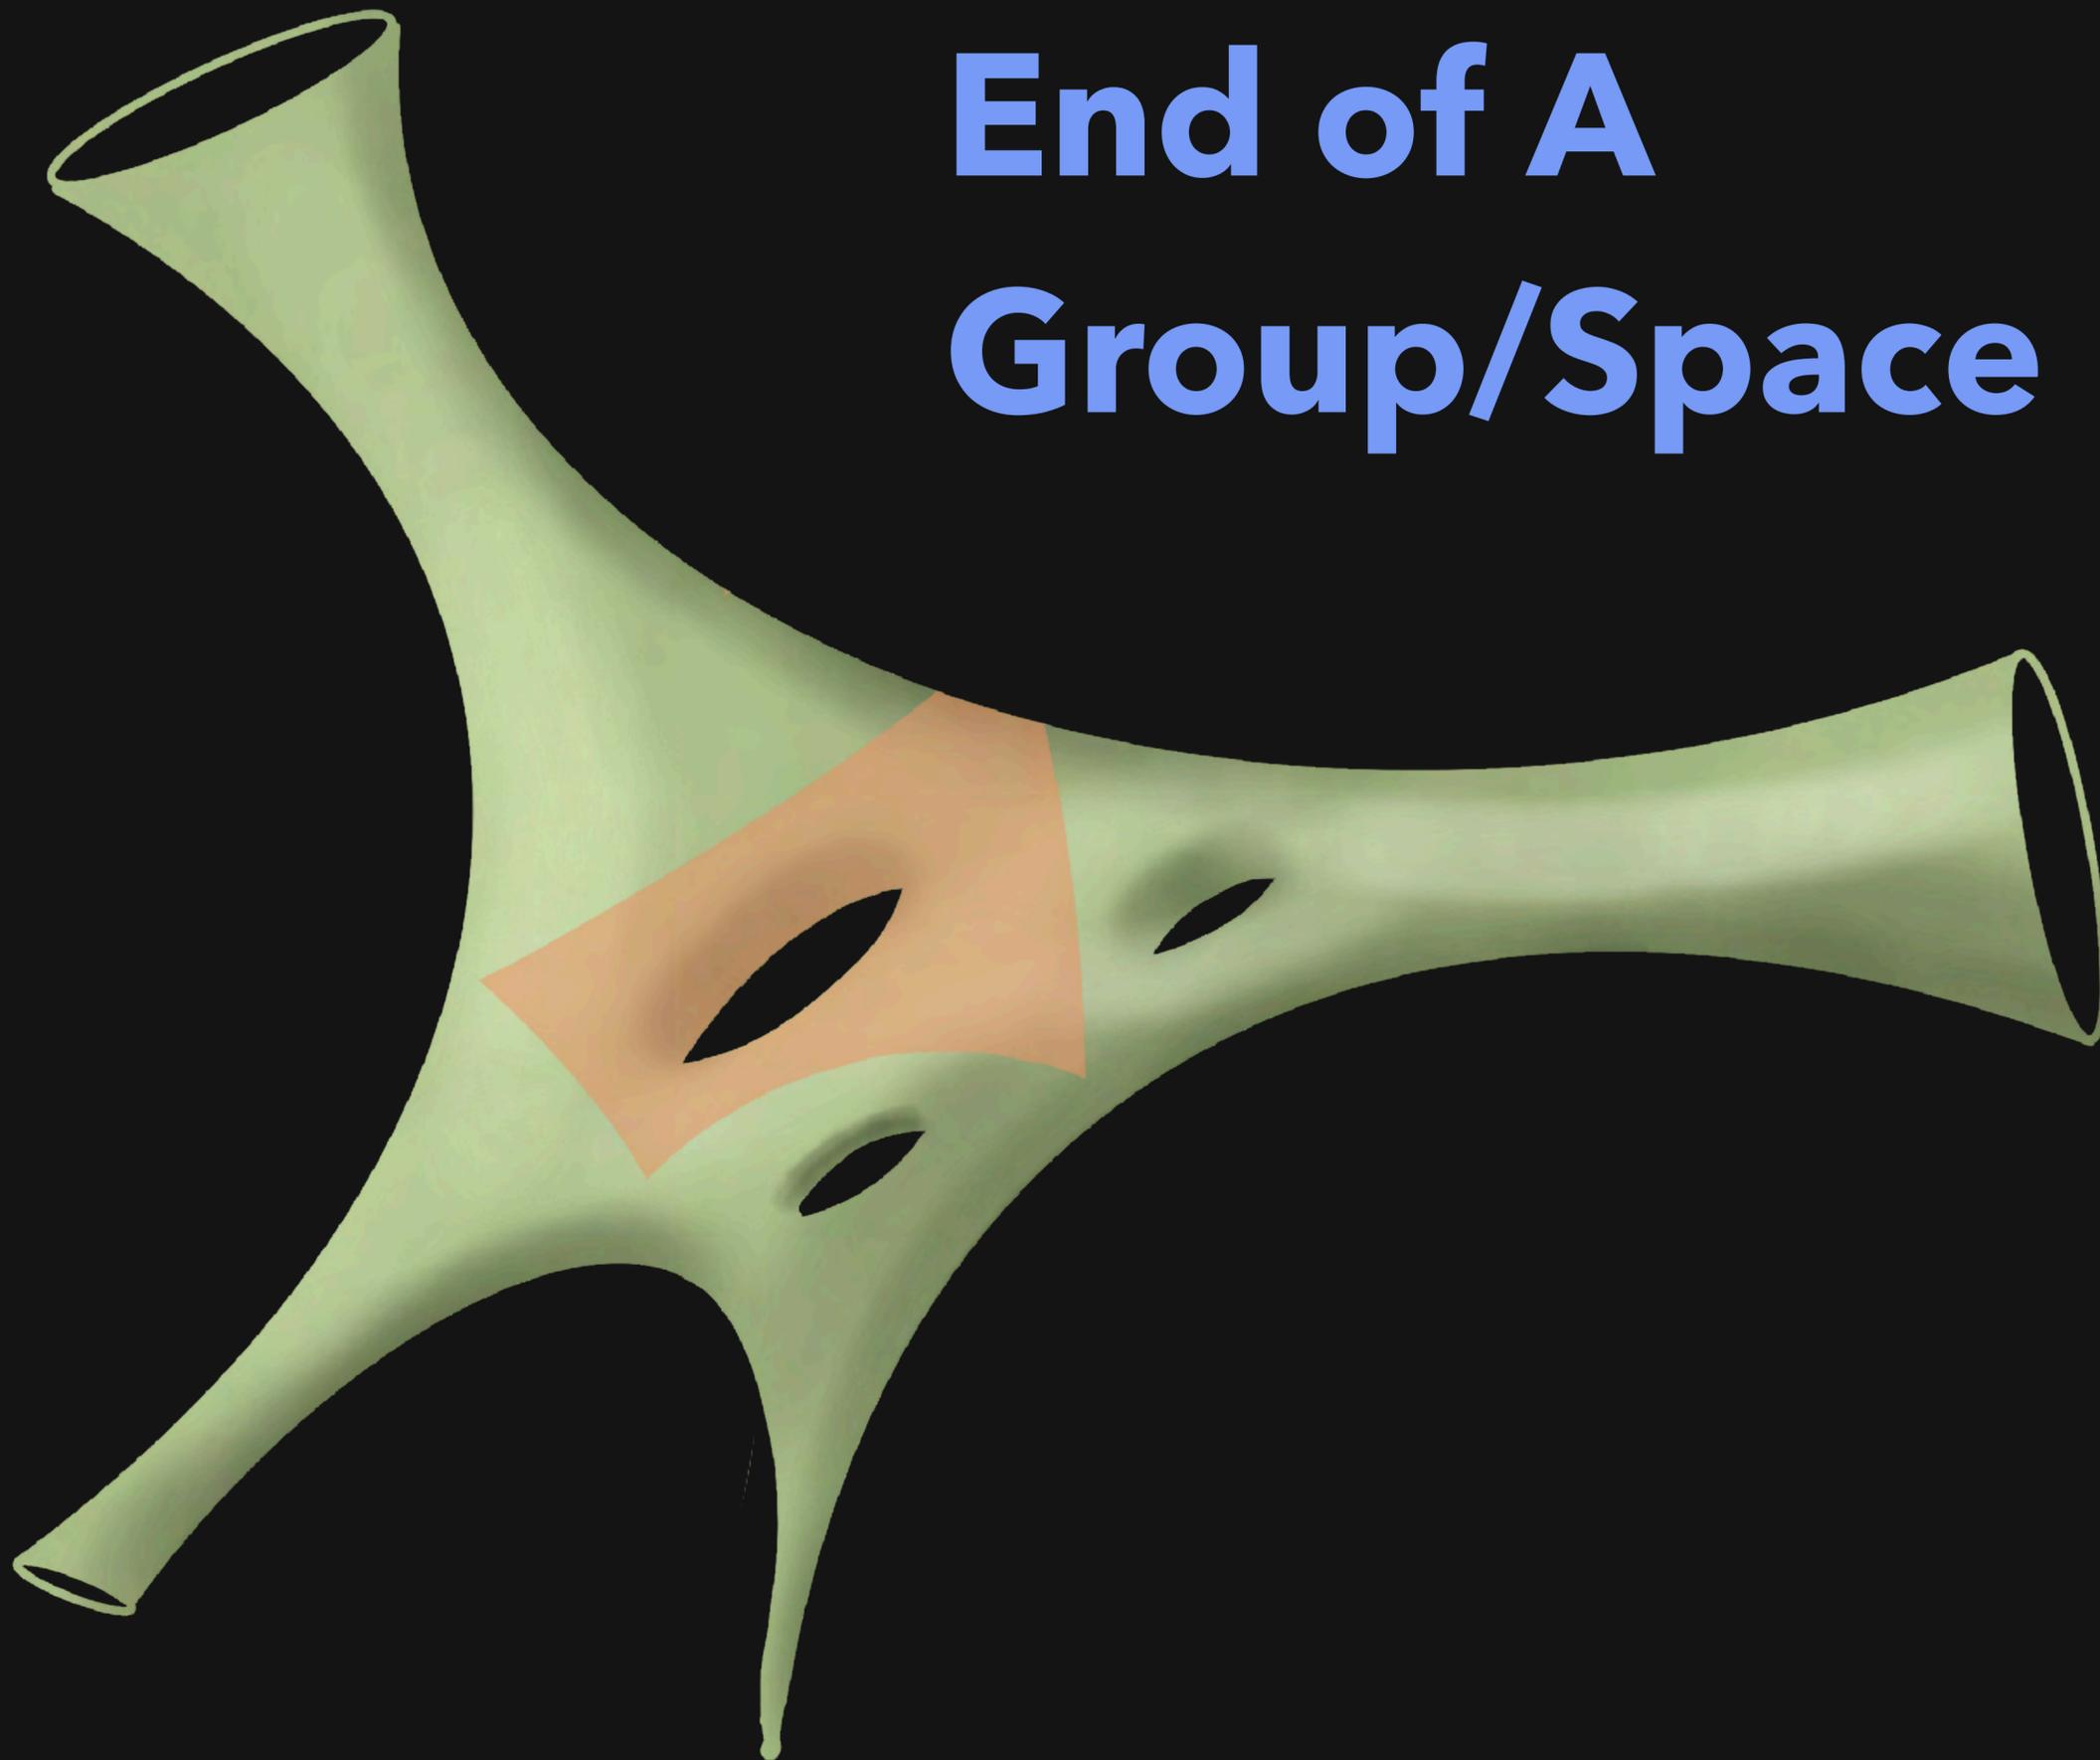

# **Our Goal Today:**

**Use Geometry to Produce groups  
with specified large-scale  
behavior**

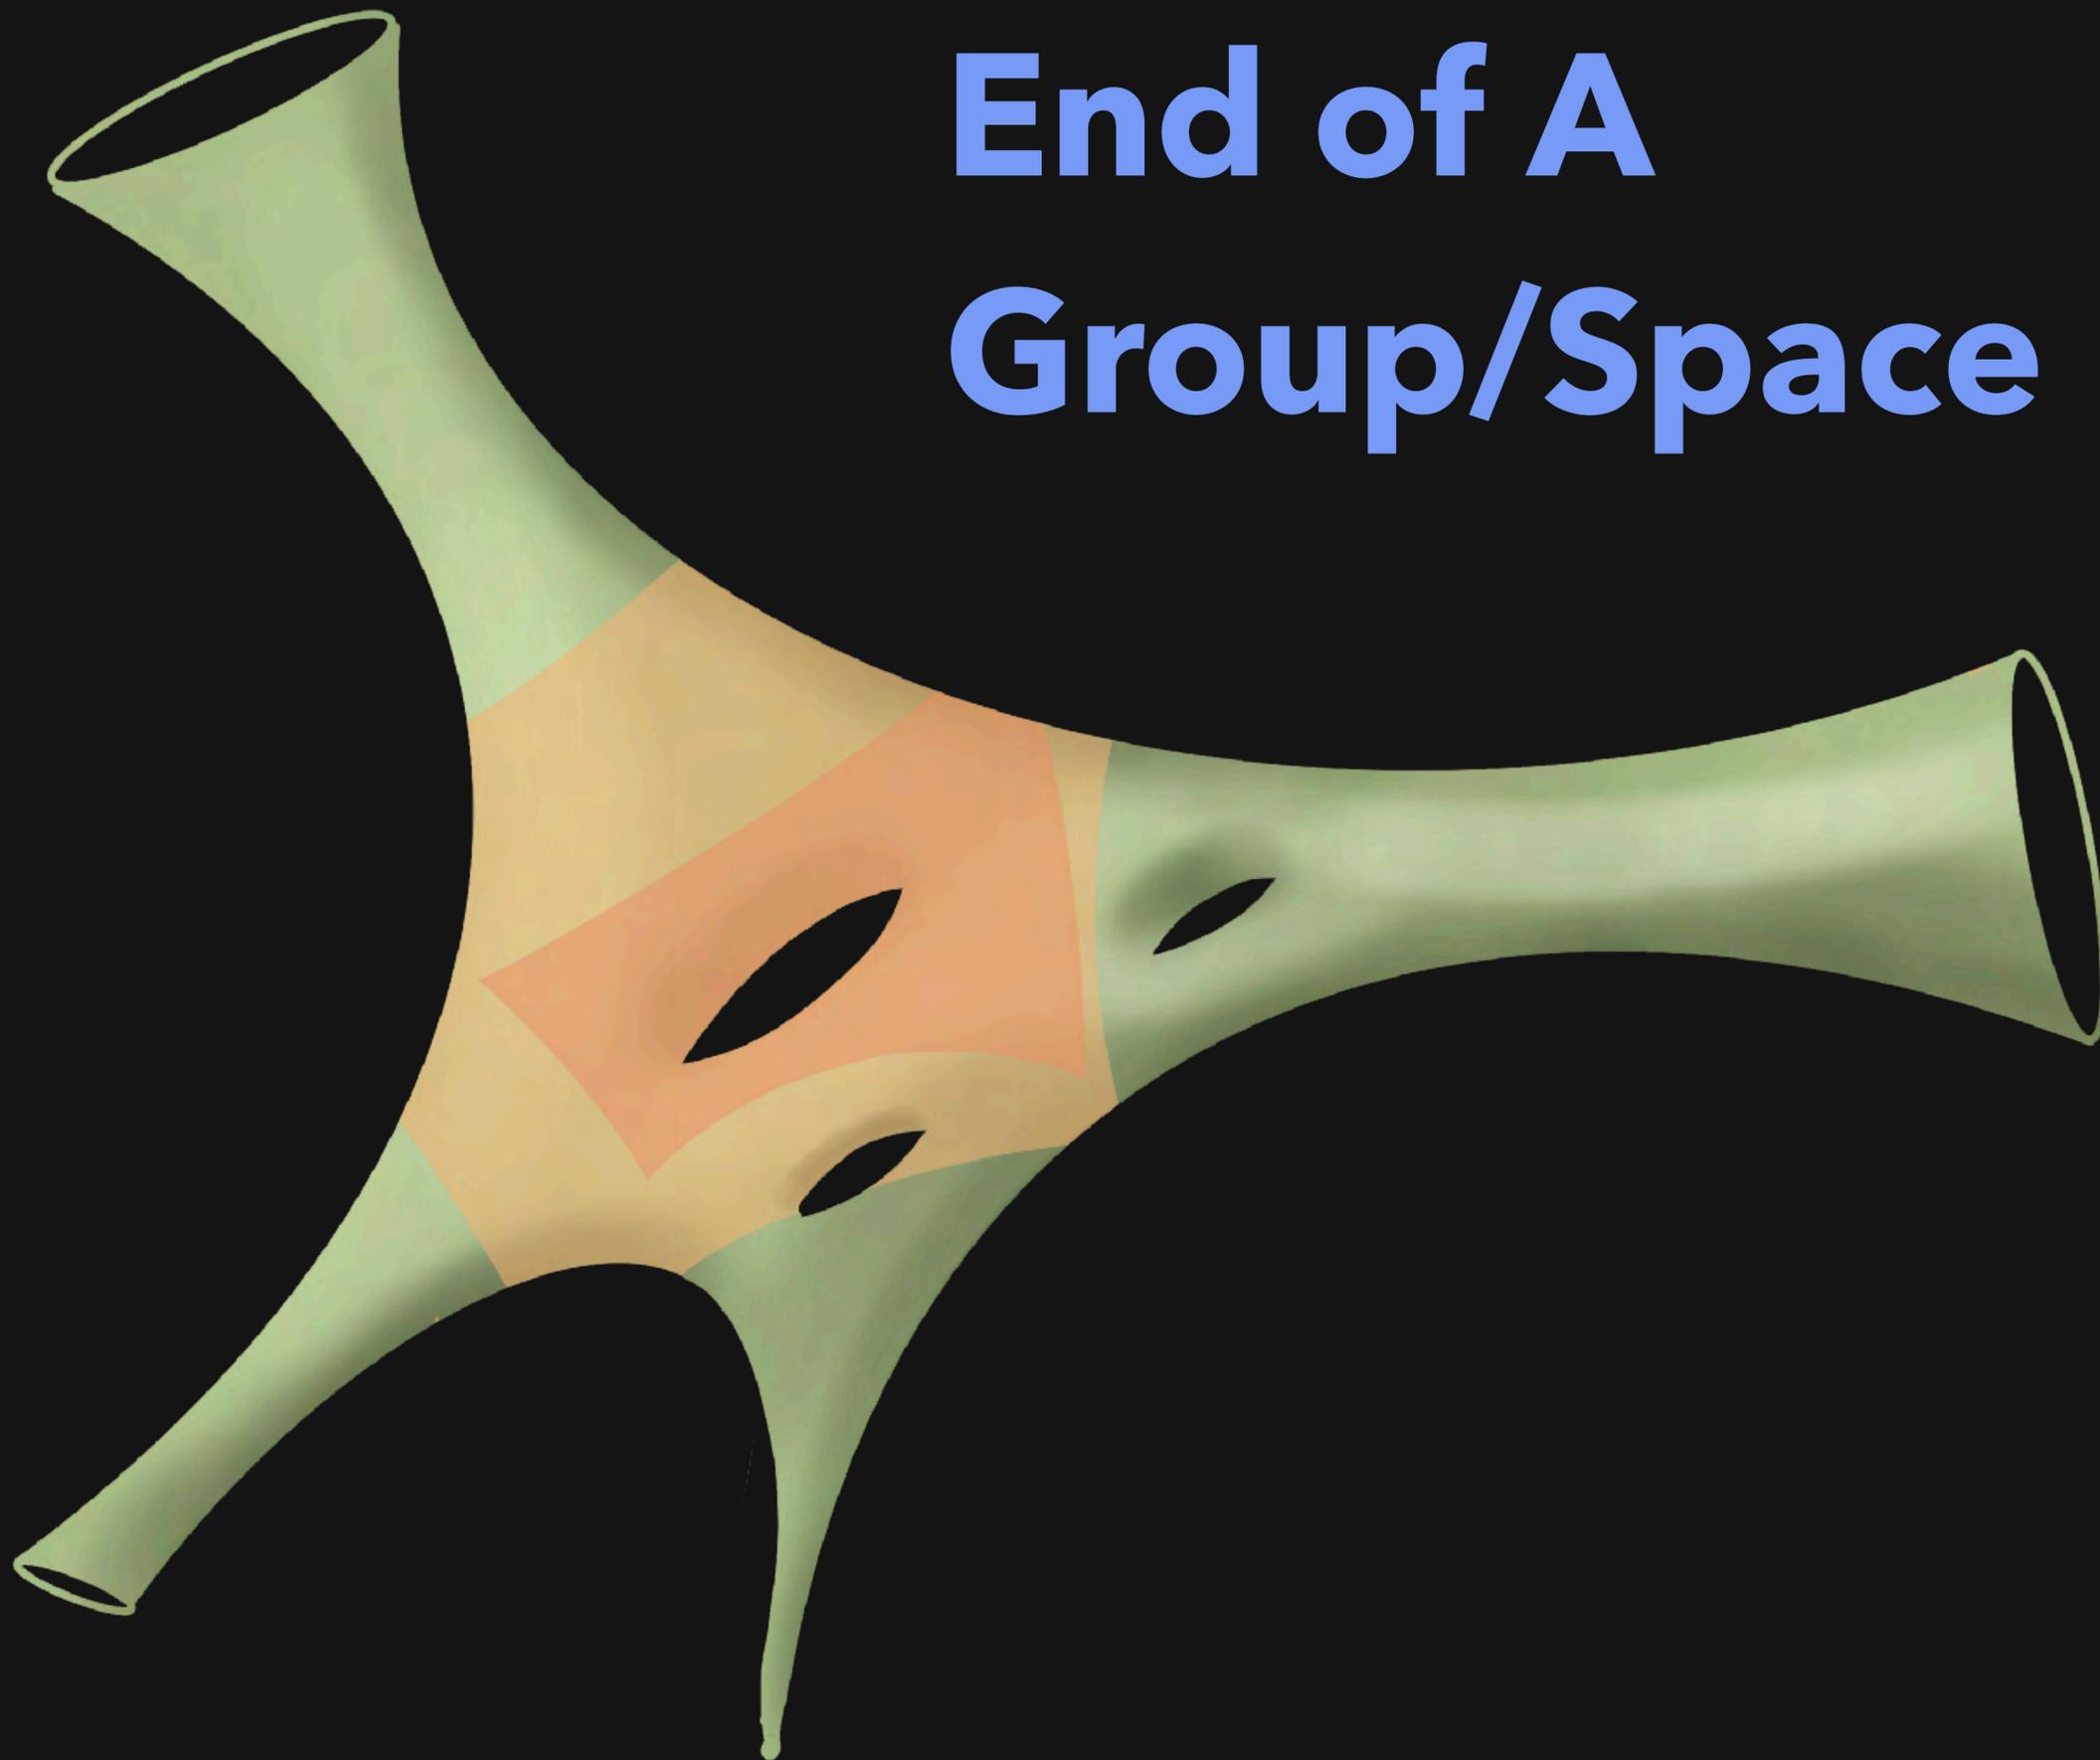

# End of A Group/Space

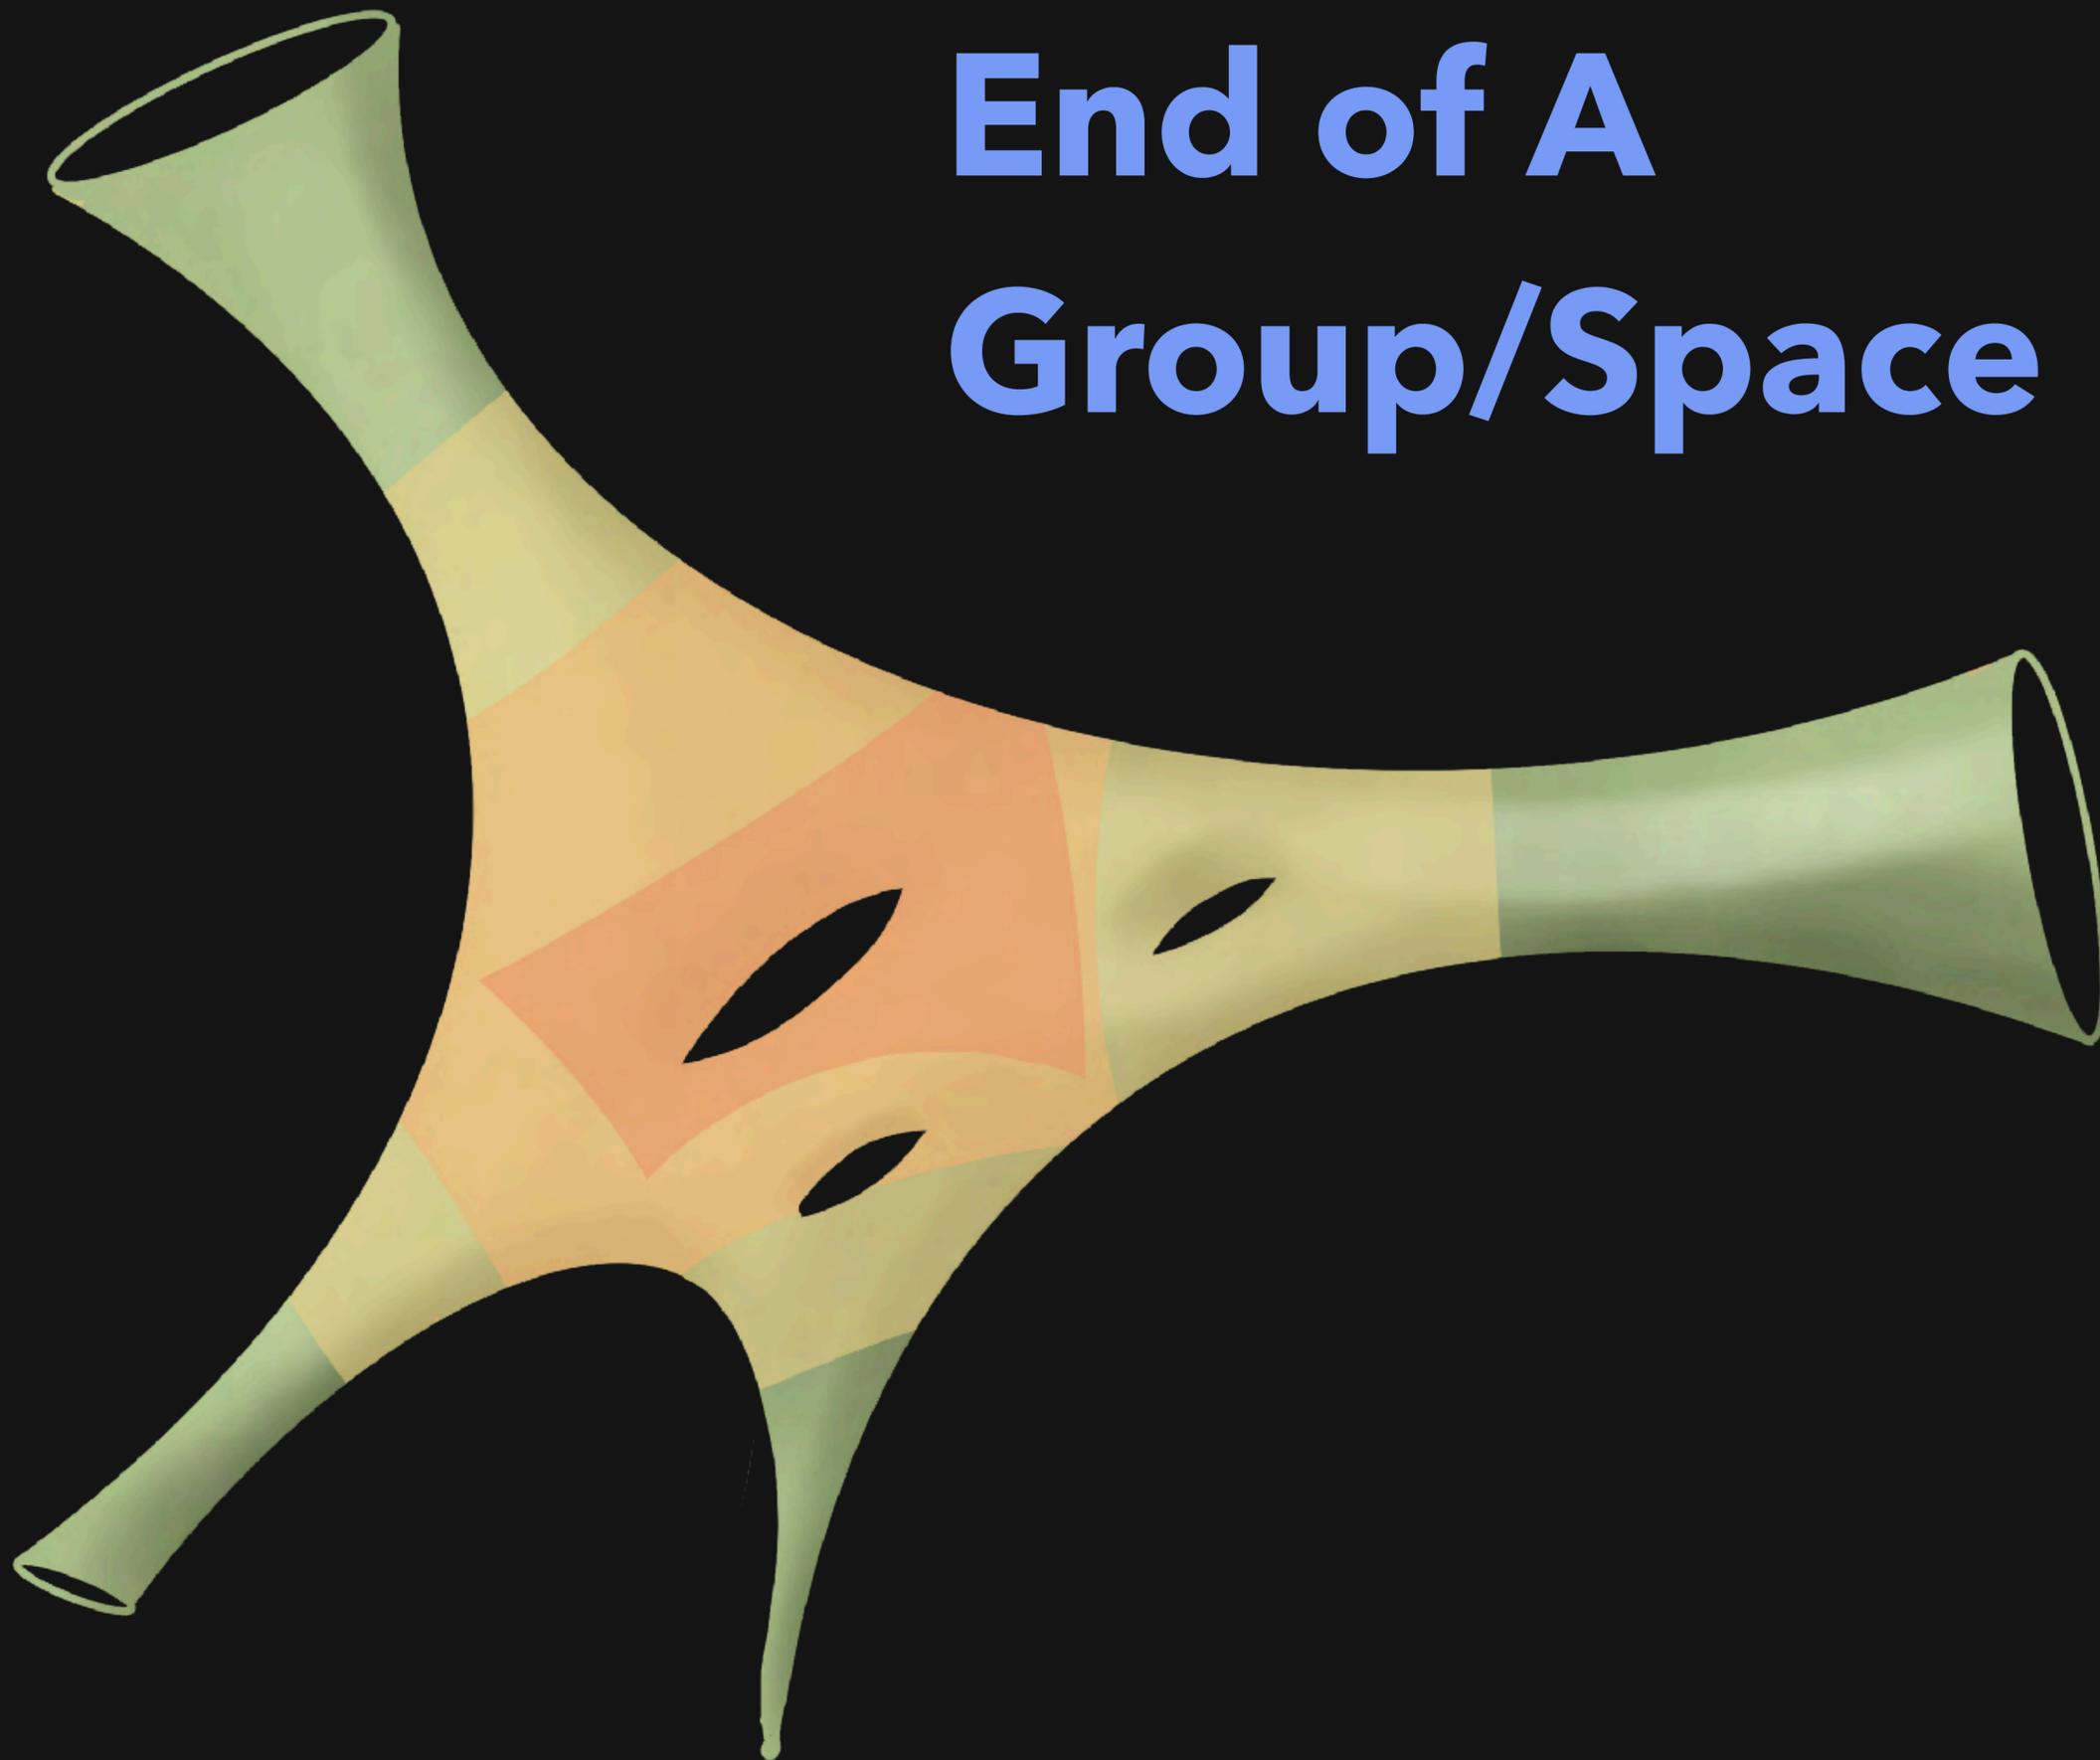

# End of A Group/Space

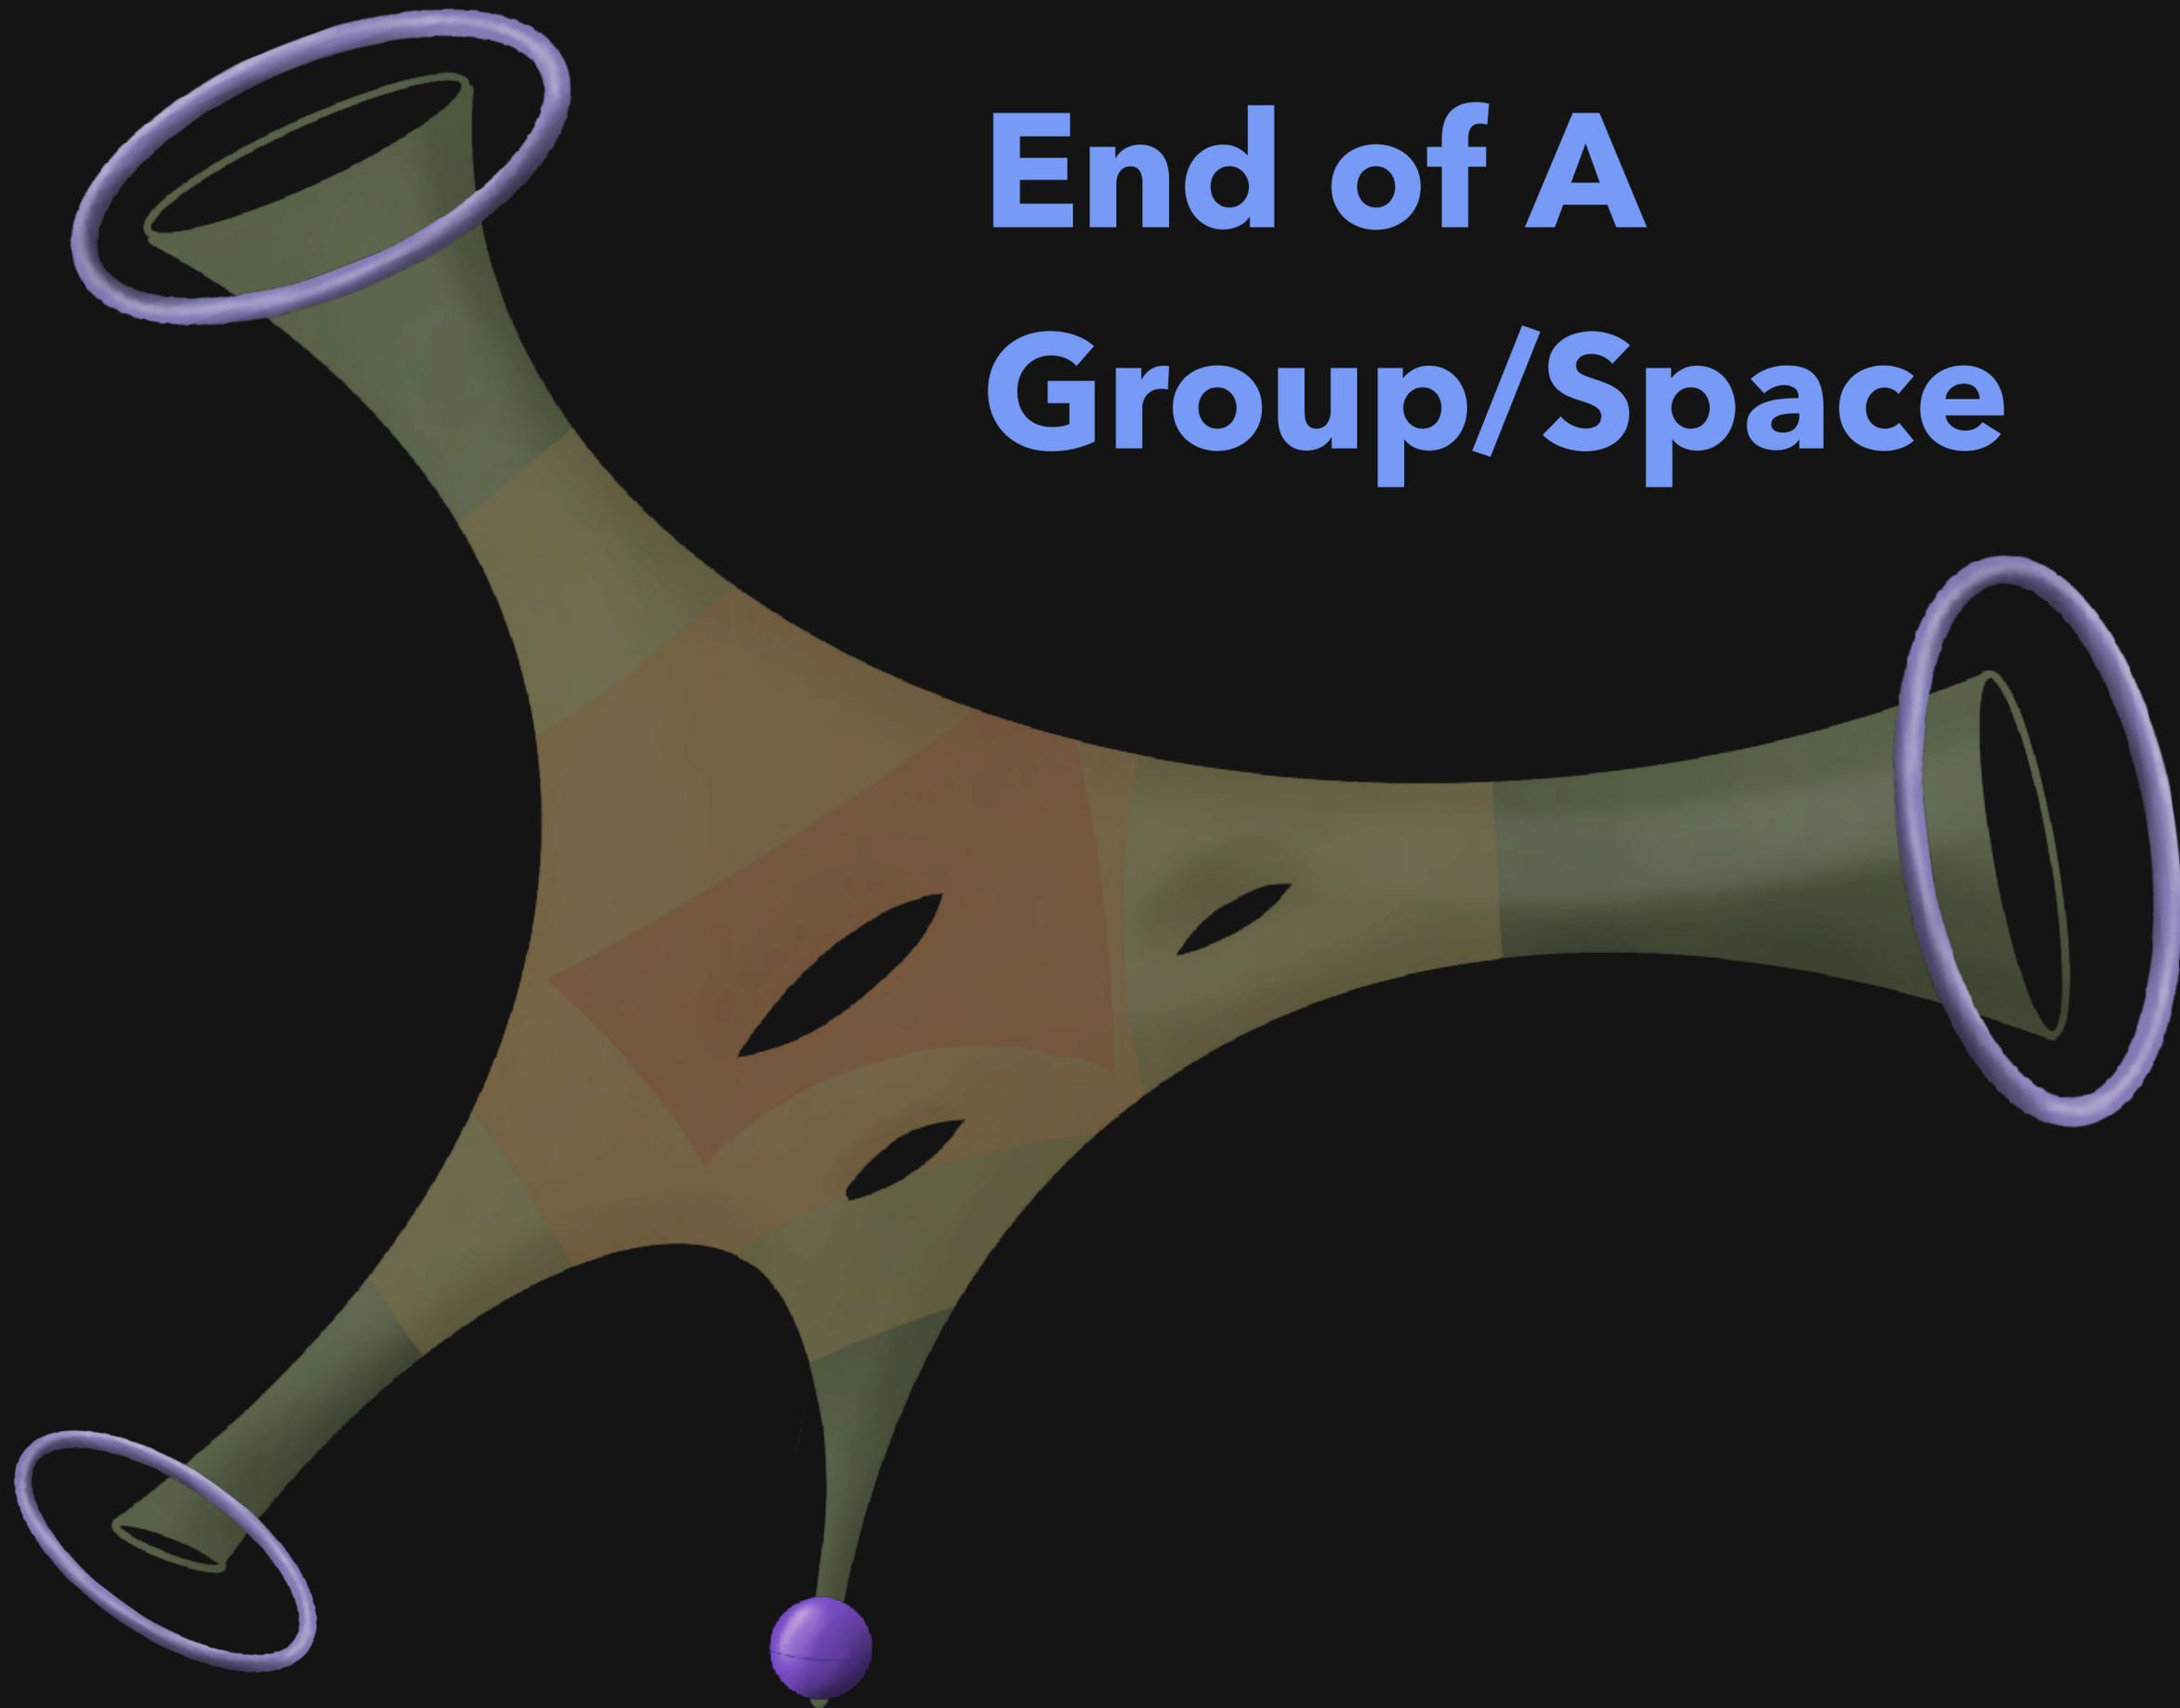

# End of A Group/Space

# End of A Group/Space

# End of A Group/Space

# End of A Group/Space

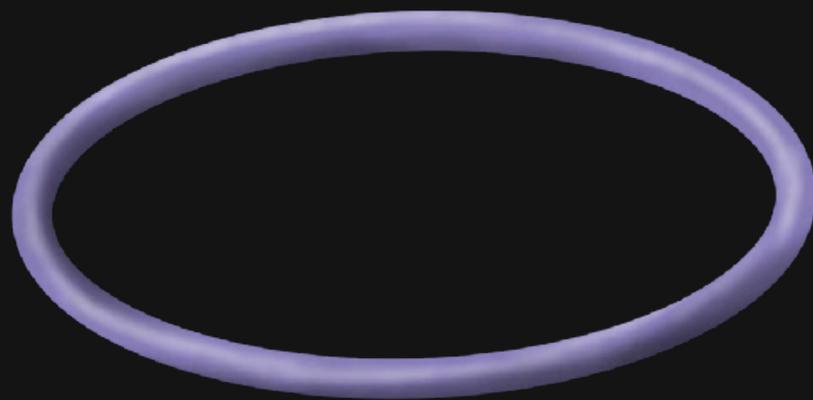

# Ends are a QI - Invariant

**If two spaces are quasi-isometric, their ends are homeomorphic.**

# Building Groups with prescribed ends:

$S^0$

$S^1$

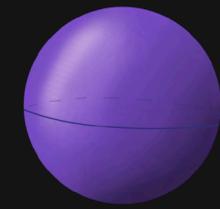

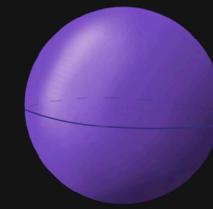

$S^2$

**Groups with boundary**

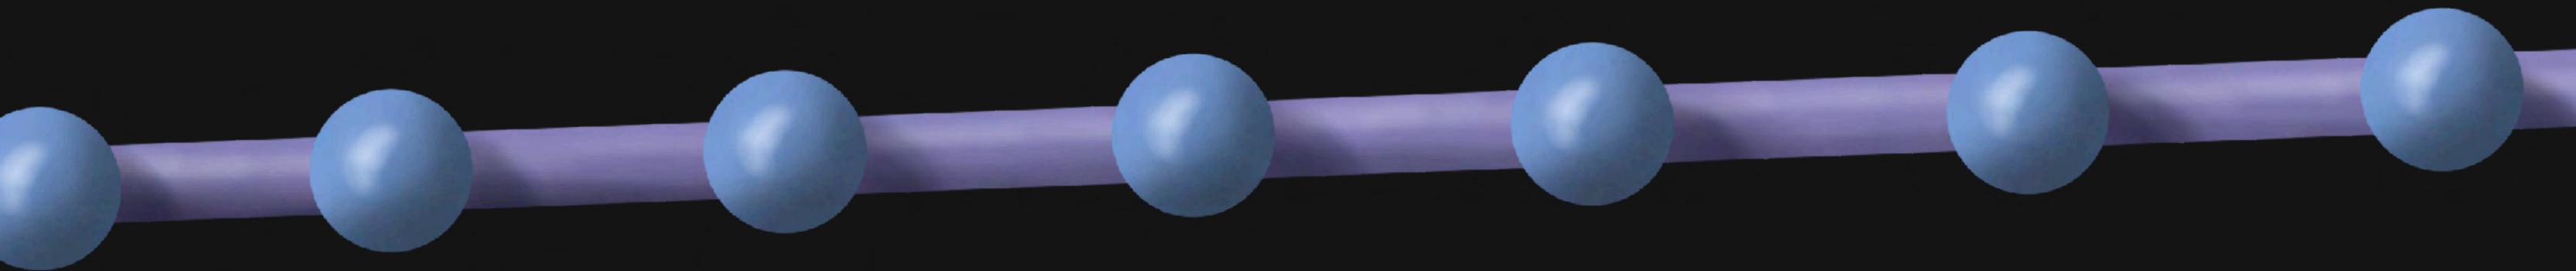

**The 0-Dimensional  
Sphere**

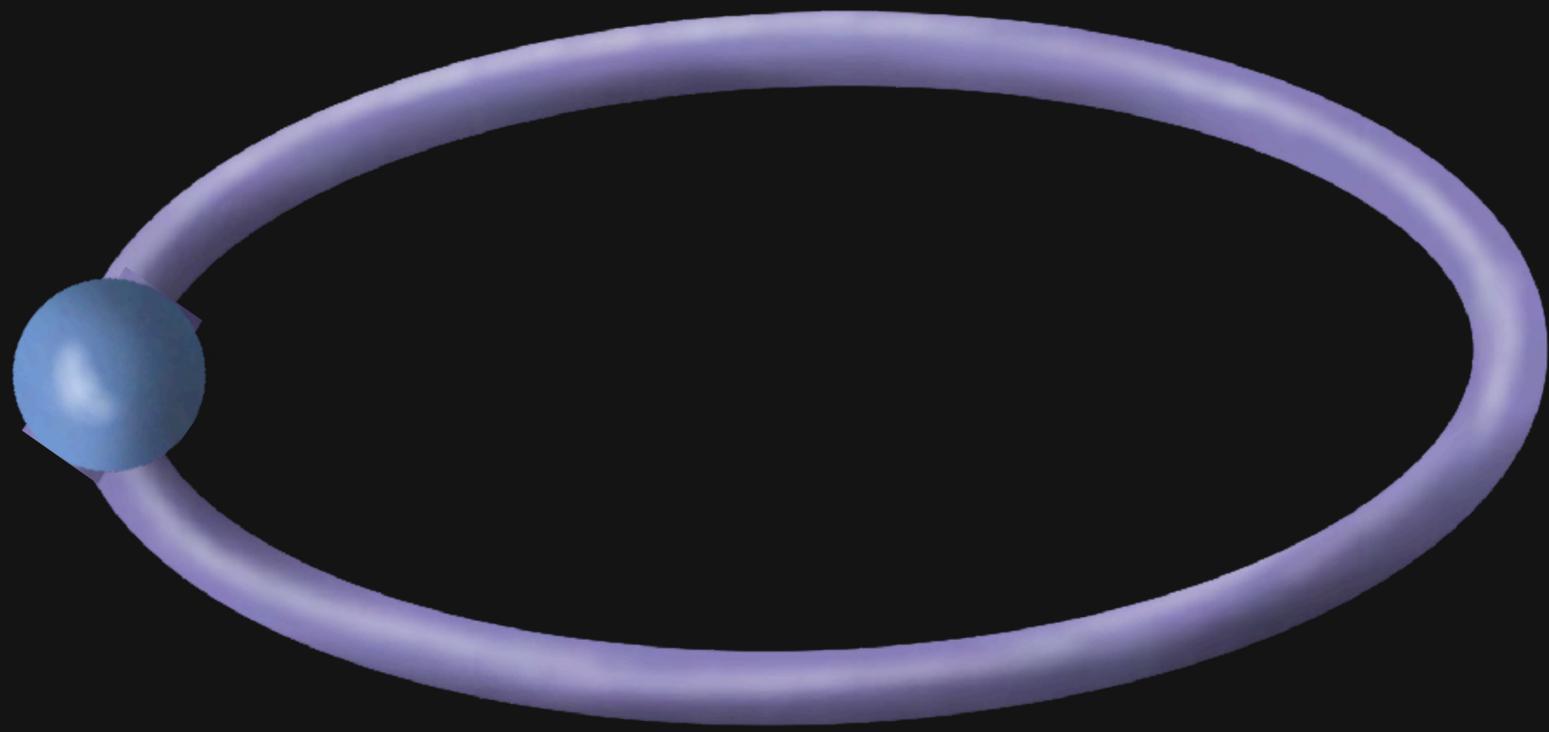

$S^0$  is two points

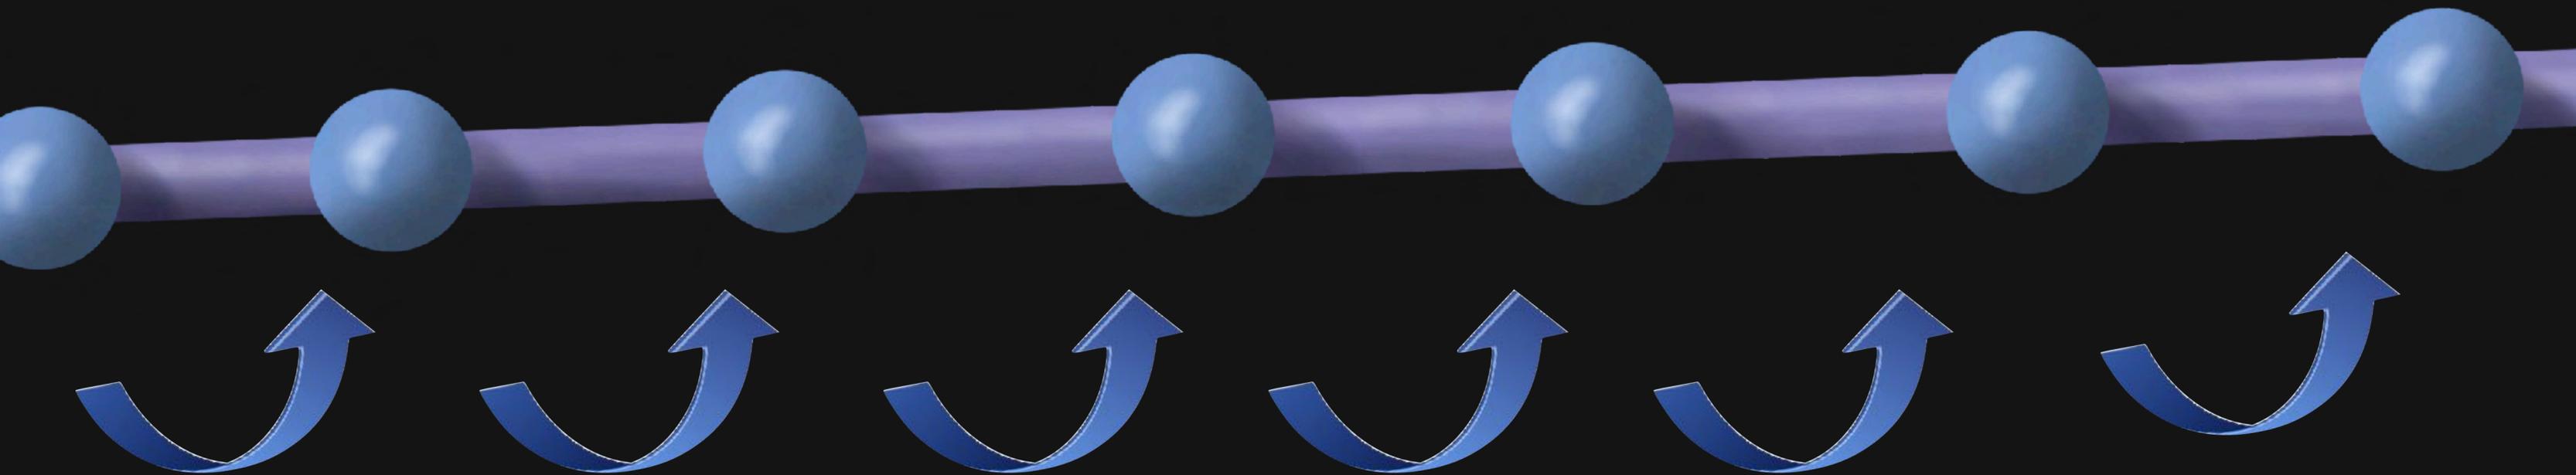

**How can we construct a group  
with two ends?**

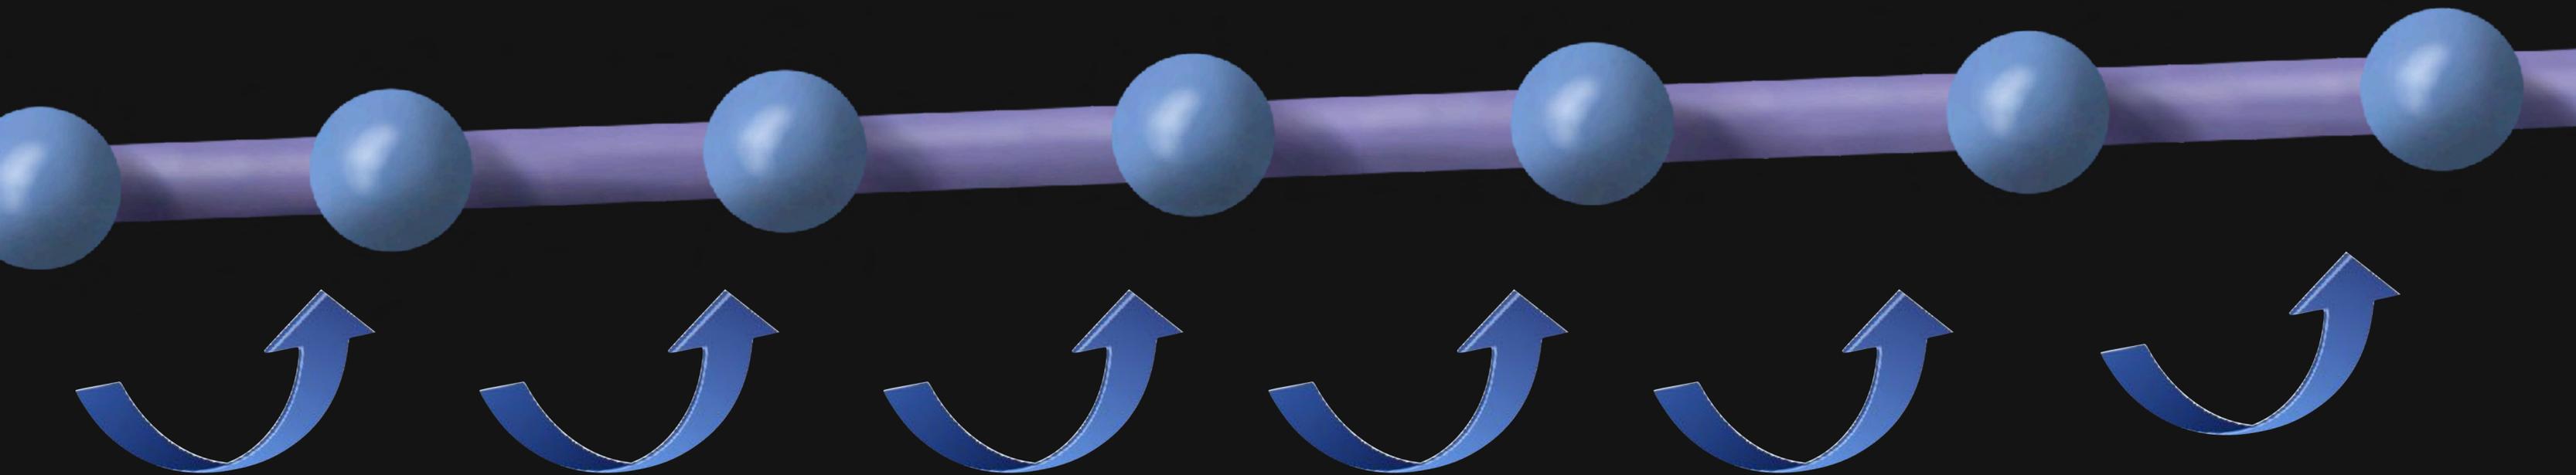

**The circle's  
universal  
cover is a  
line**

$$\pi_1(S^1) \cong \mathbb{Z}$$

**The deck group acts geometrically**

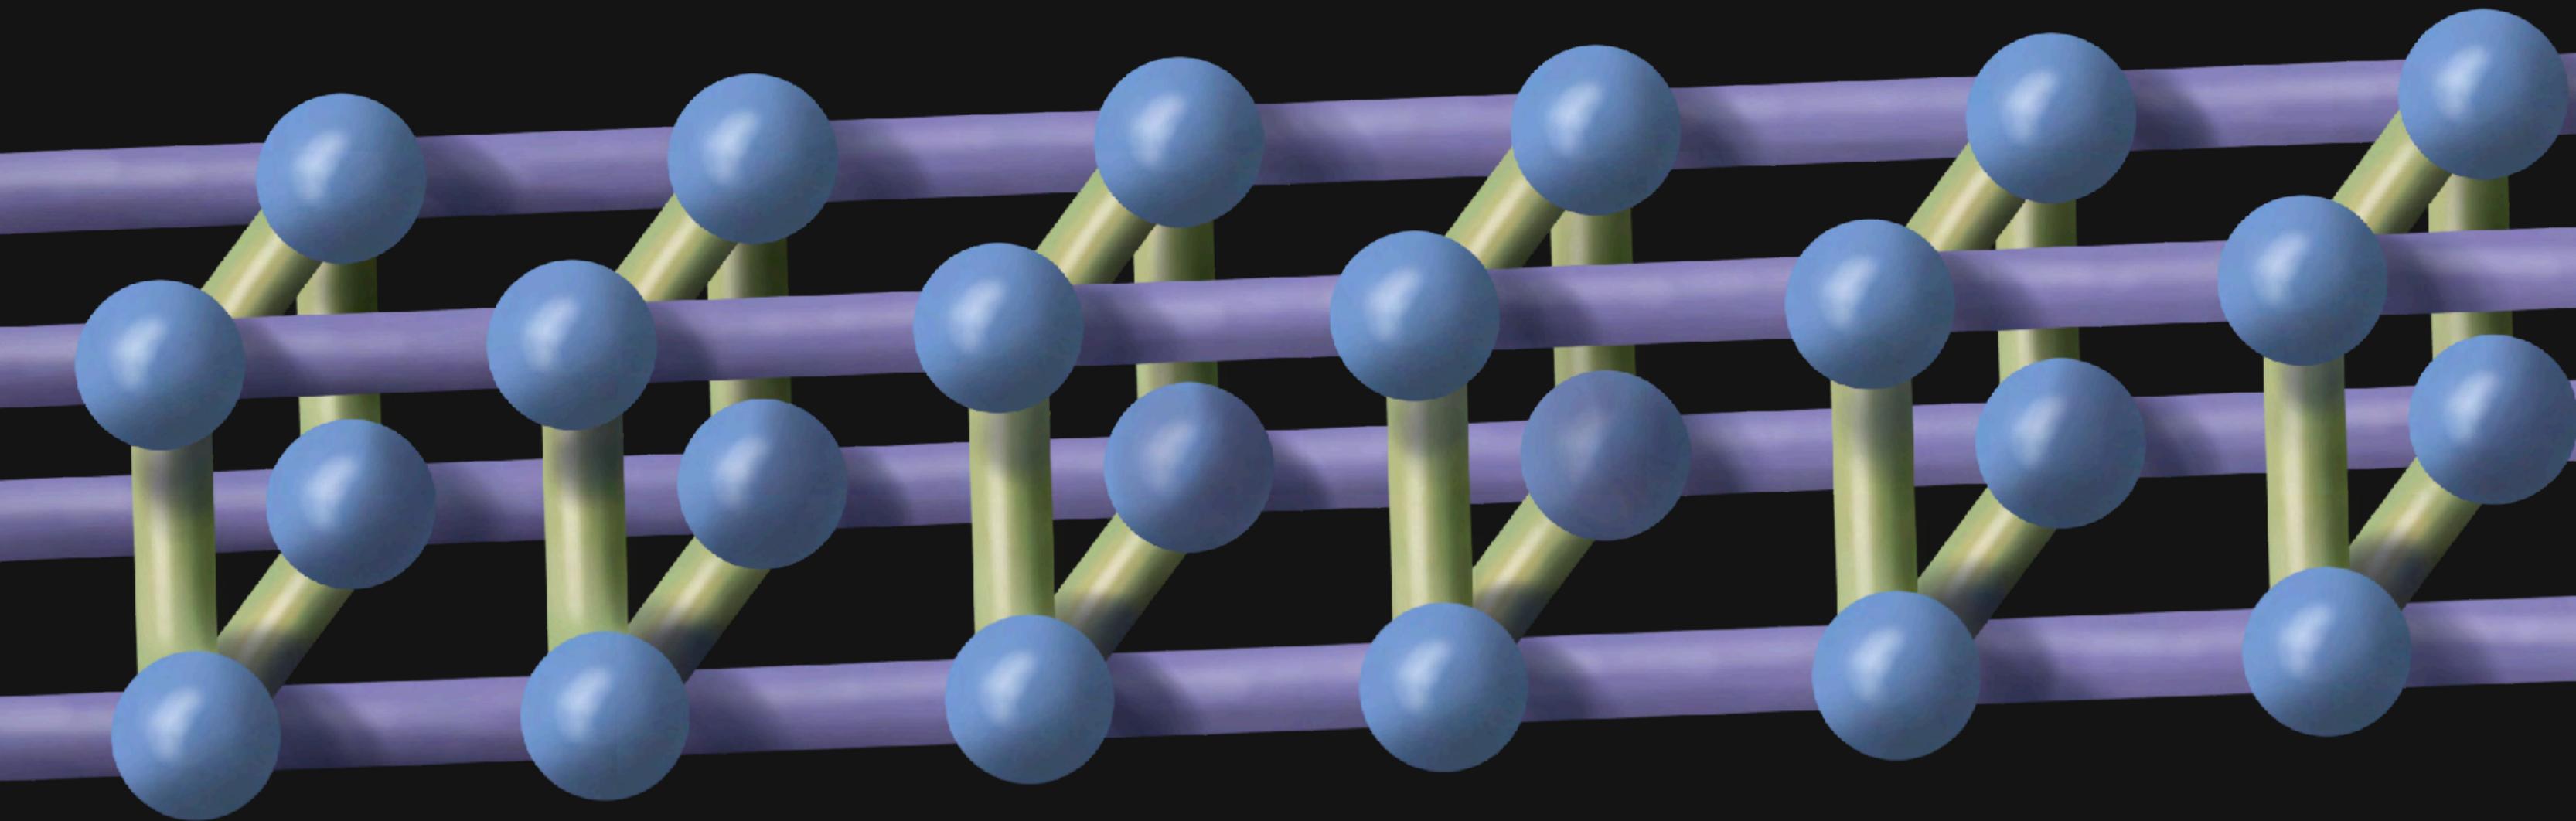

$$\pi_1(S^1) \cong \mathbb{Z}$$

**Thus,  $\mathbb{Z}$  is QI to the line, which has two ends, so  $\mathbb{Z}$  has two ends.**

# This is virtually it:

Freudenthal-Hopf

## All other examples are virtually $\mathbb{Z}$

**Groups with boundary**

**The 1-Dimensional  
Sphere**

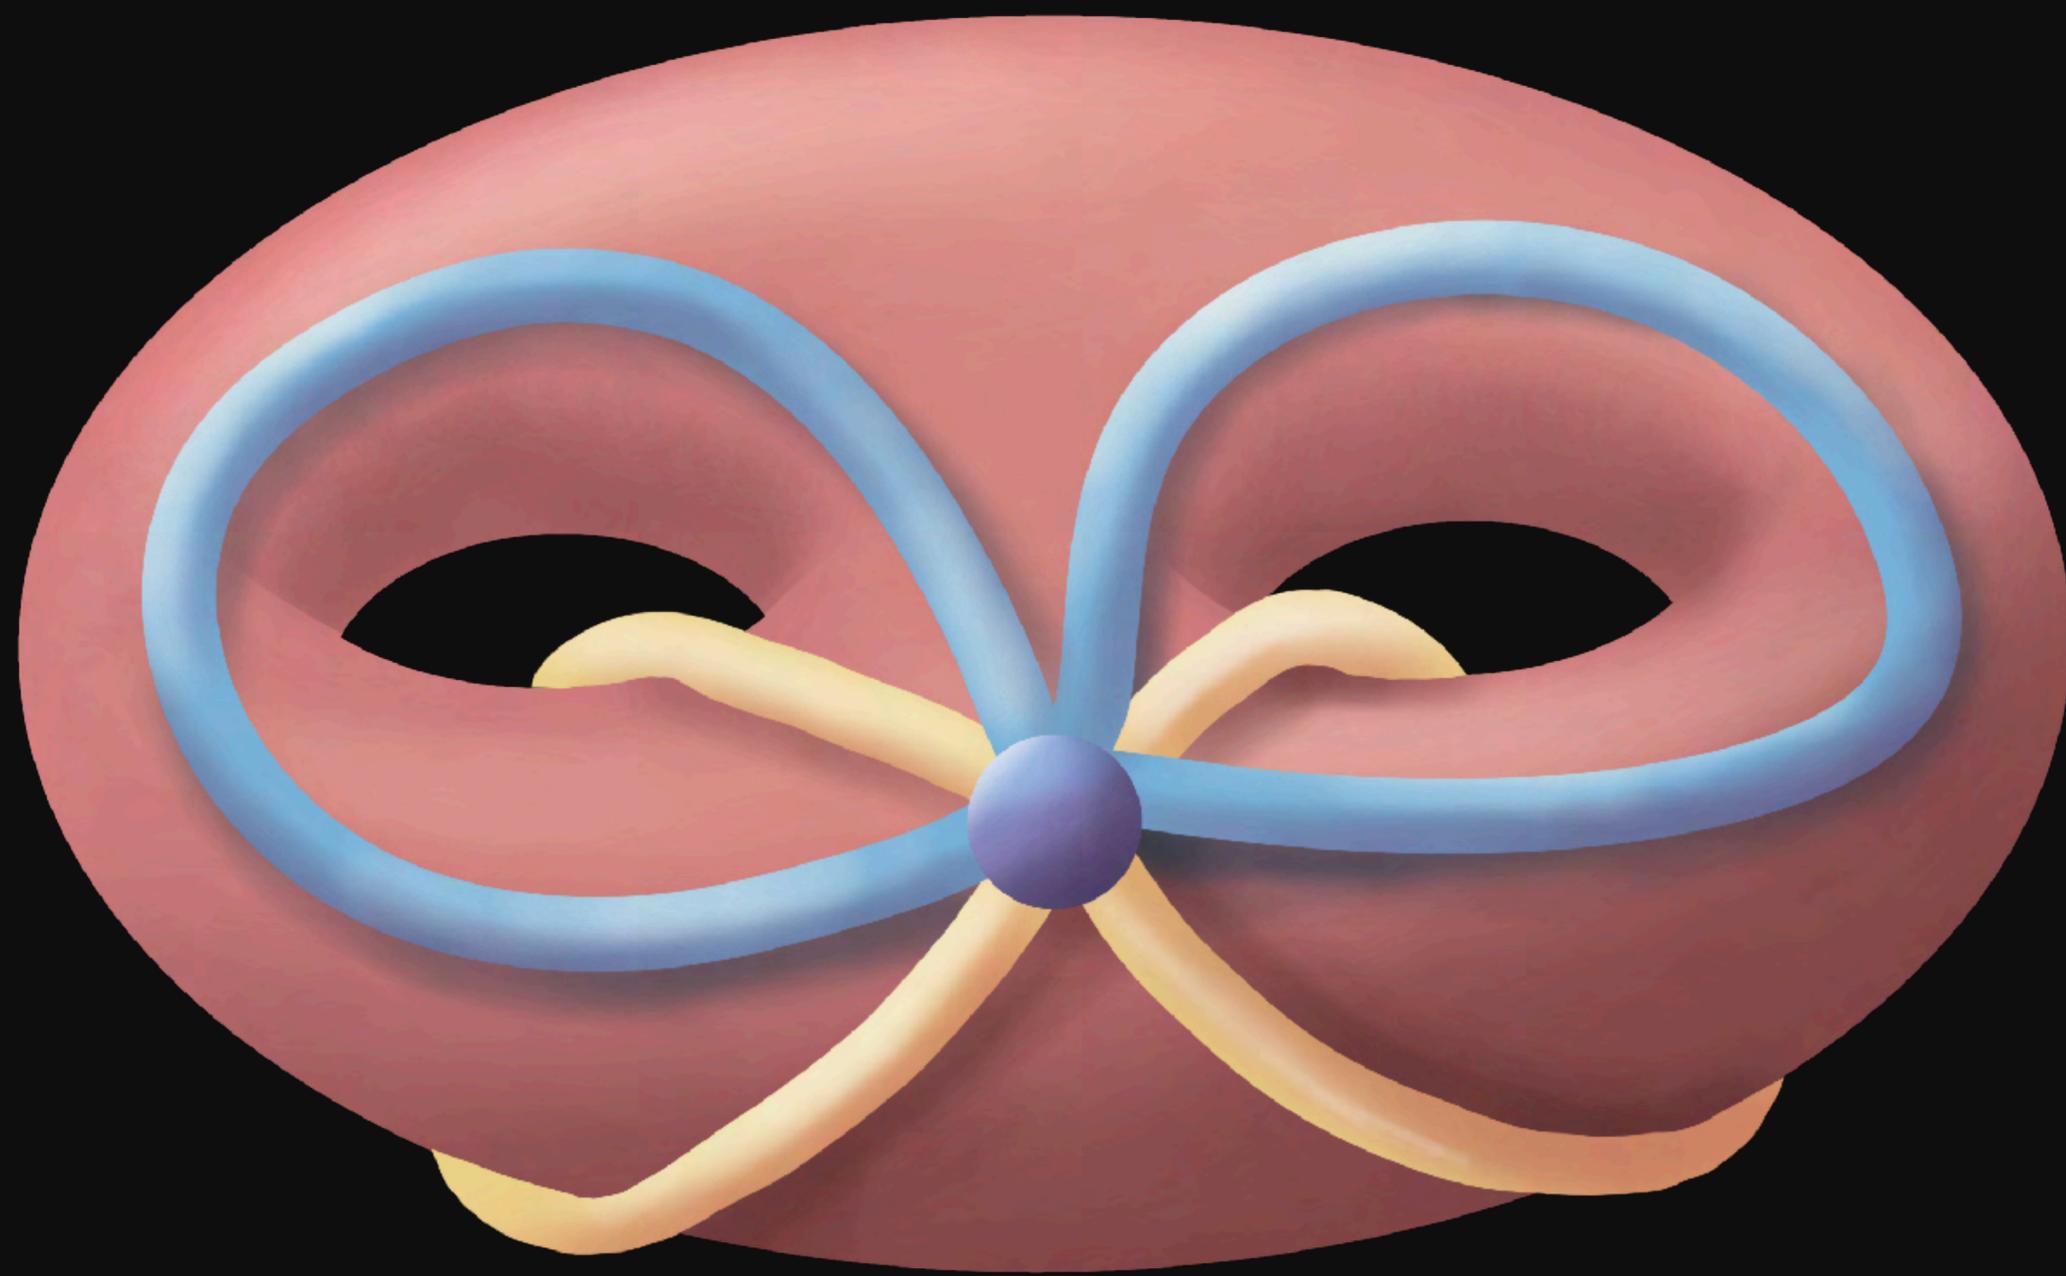

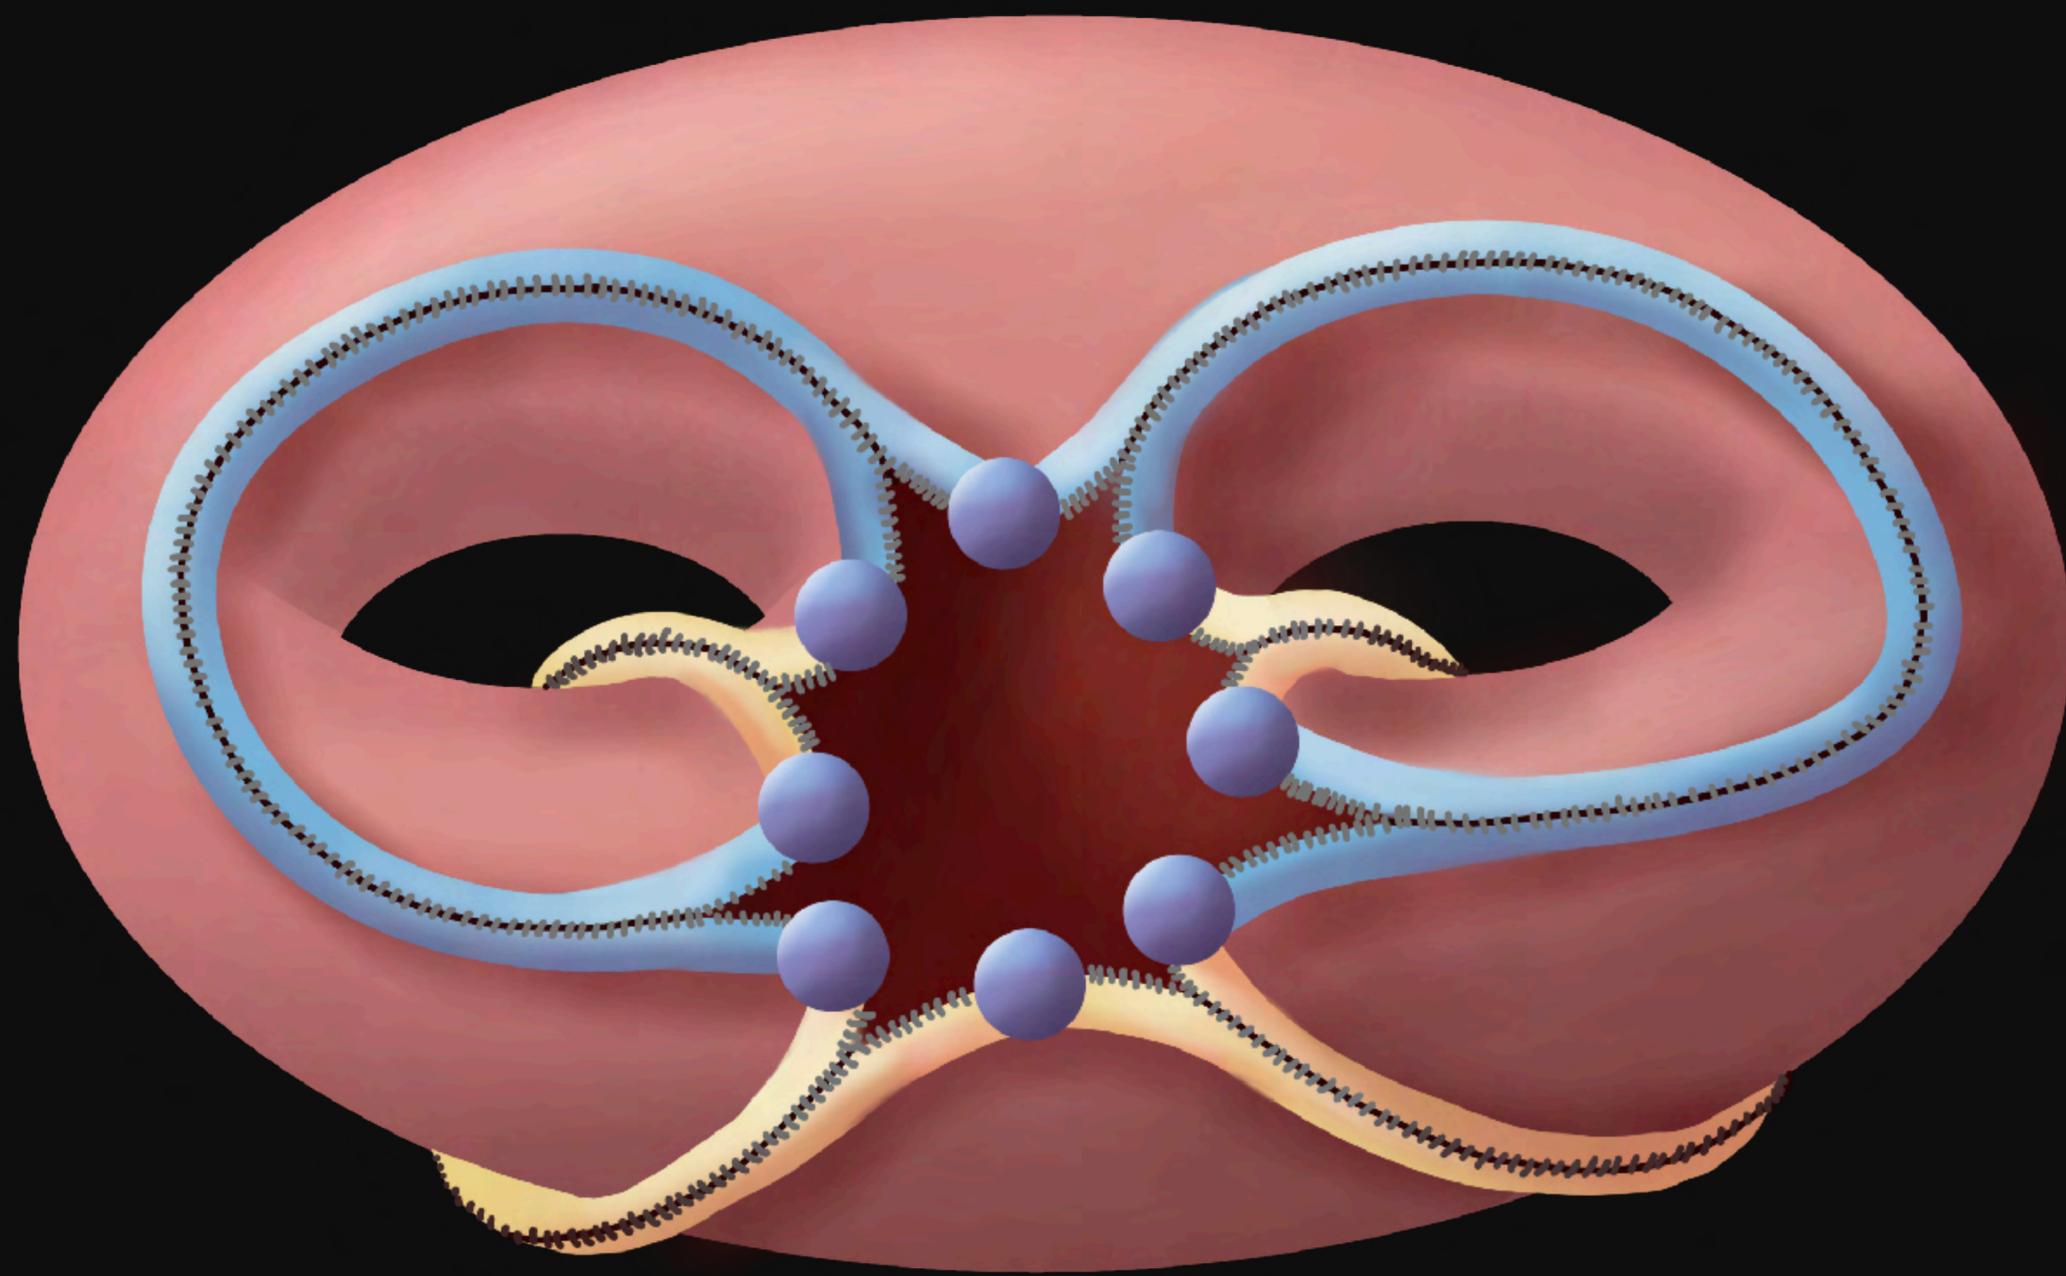

**Use the geometry of surfaces  
to produce examples.**

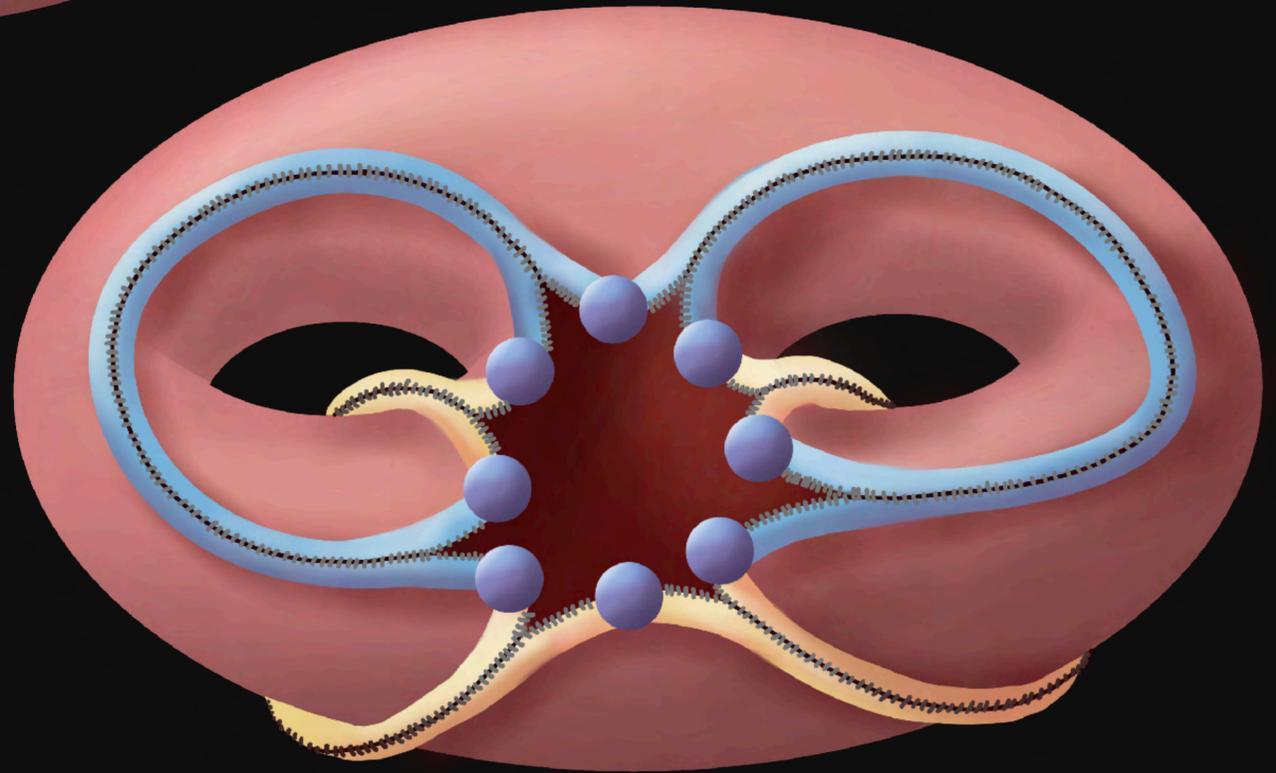

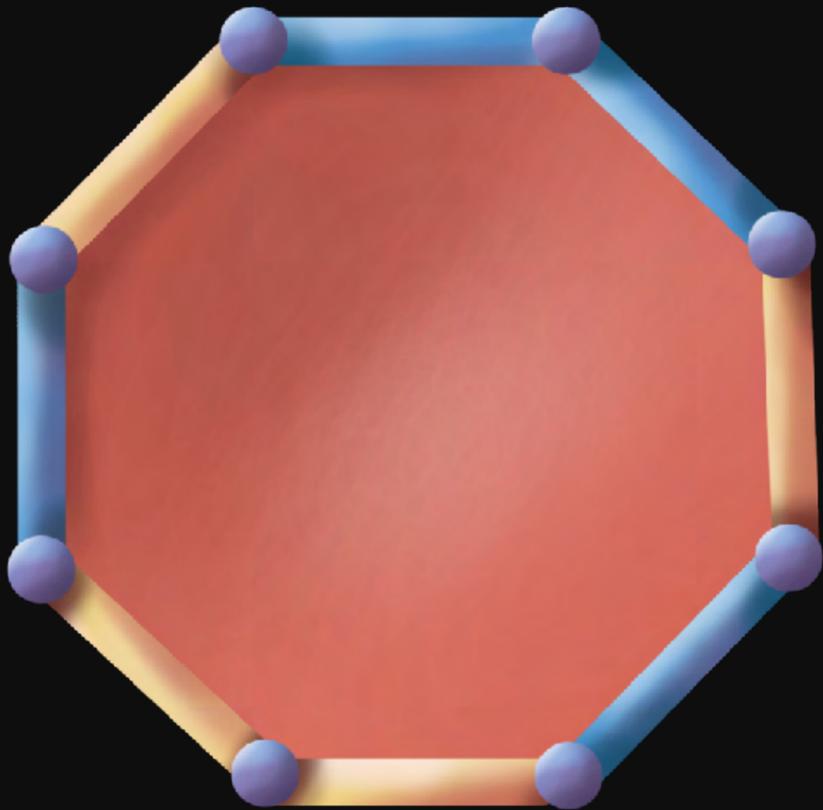

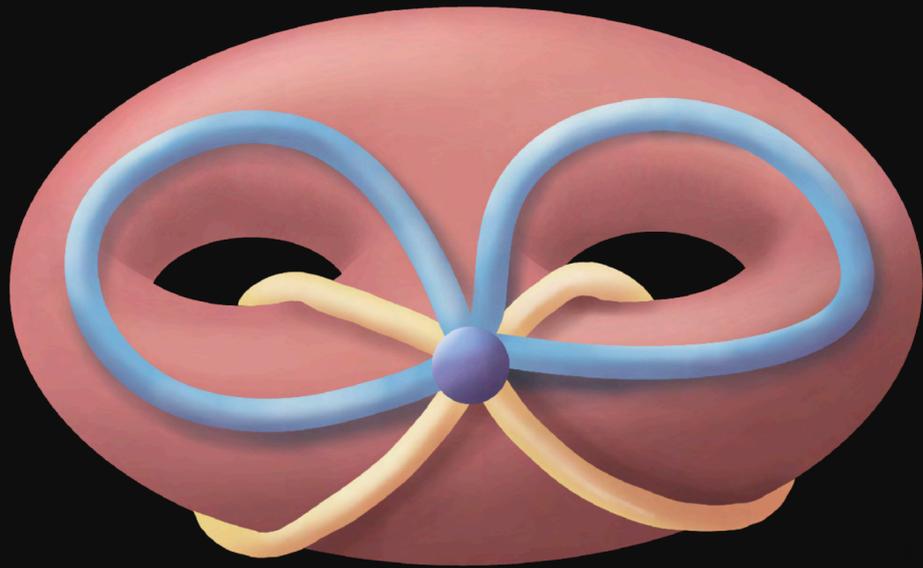

$\Sigma_2$

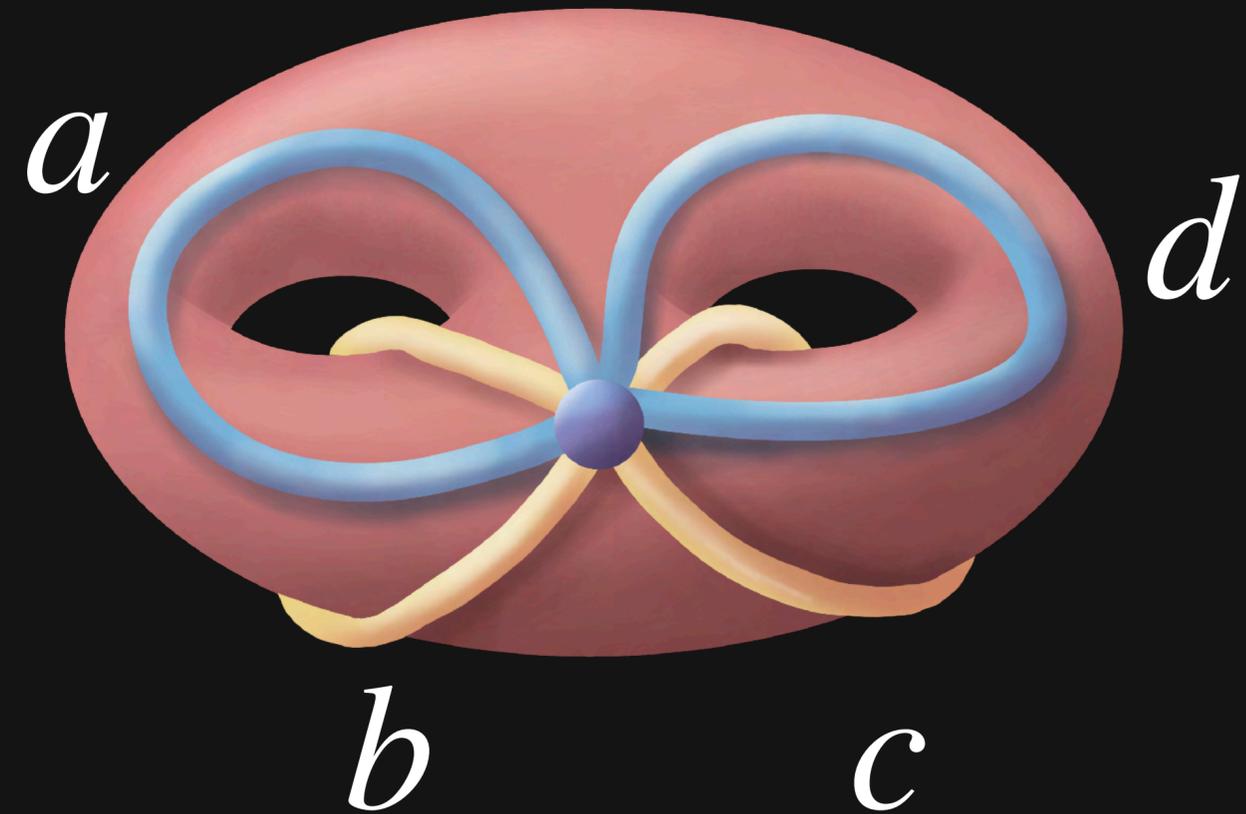

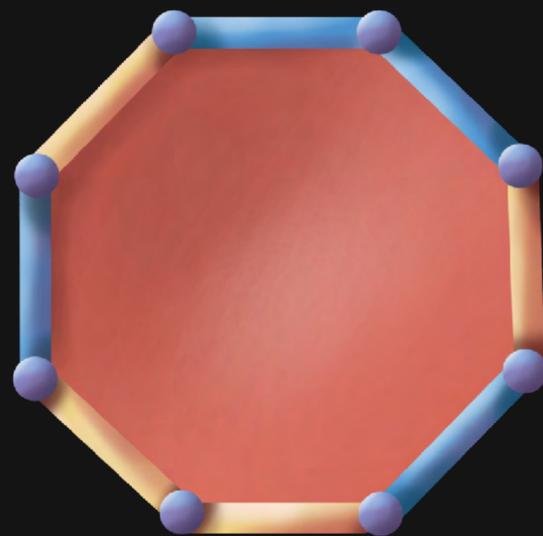

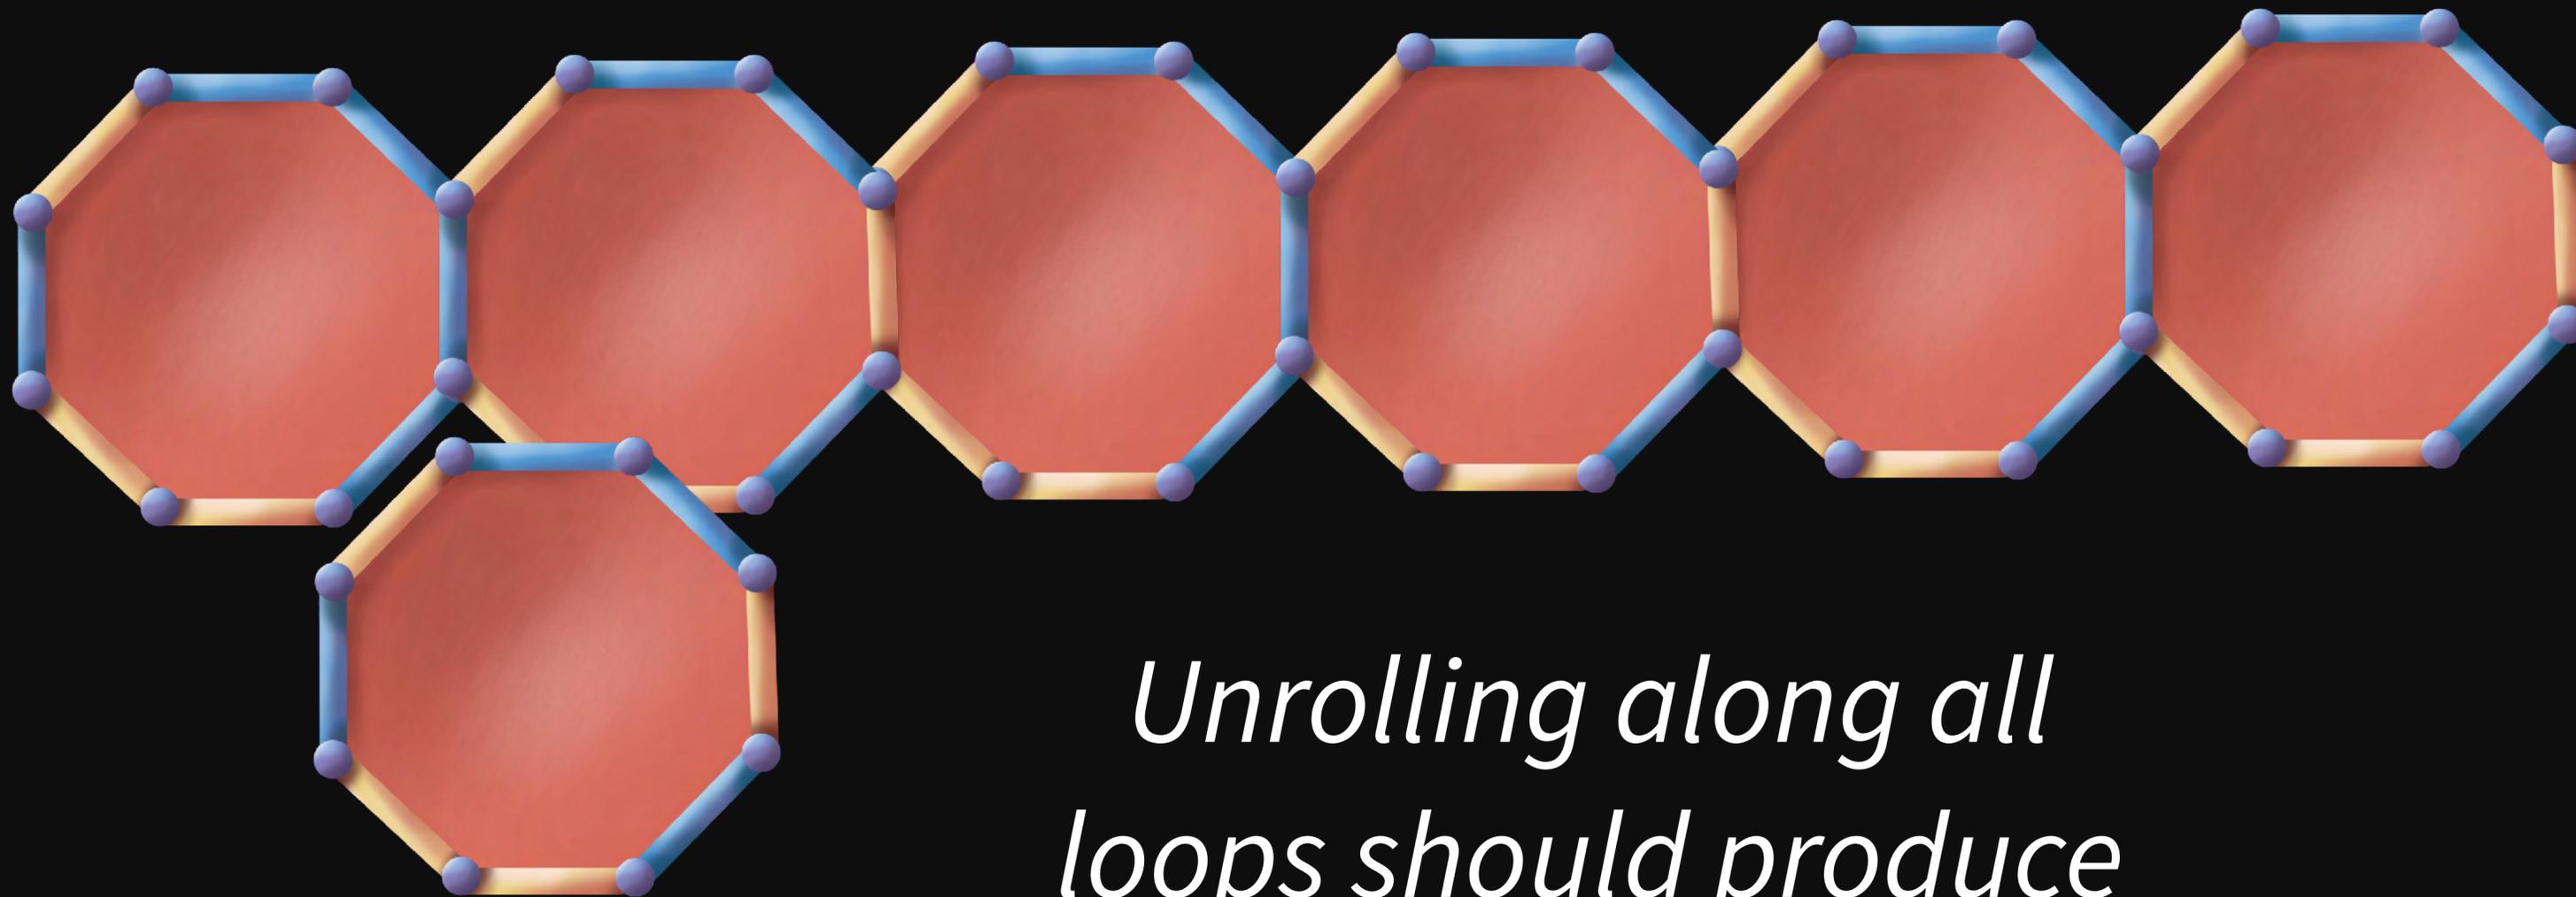

**This gives us a  
presentation  
of  $\pi_1(\Sigma_2)$**

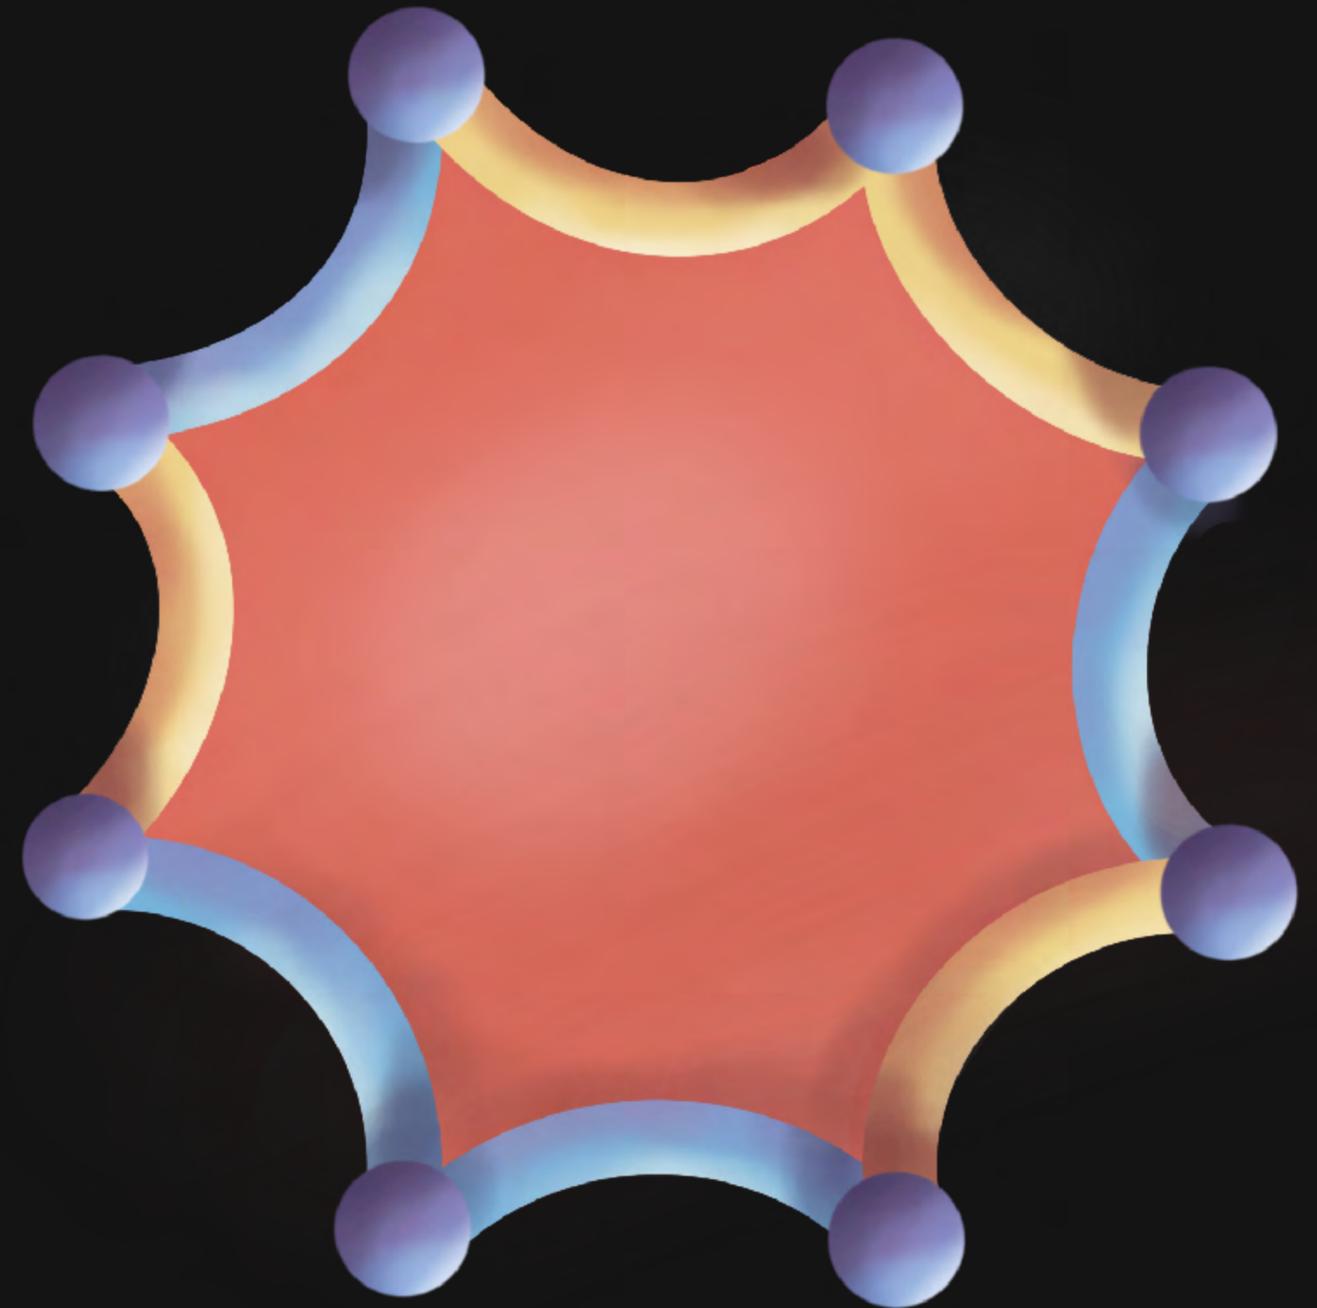

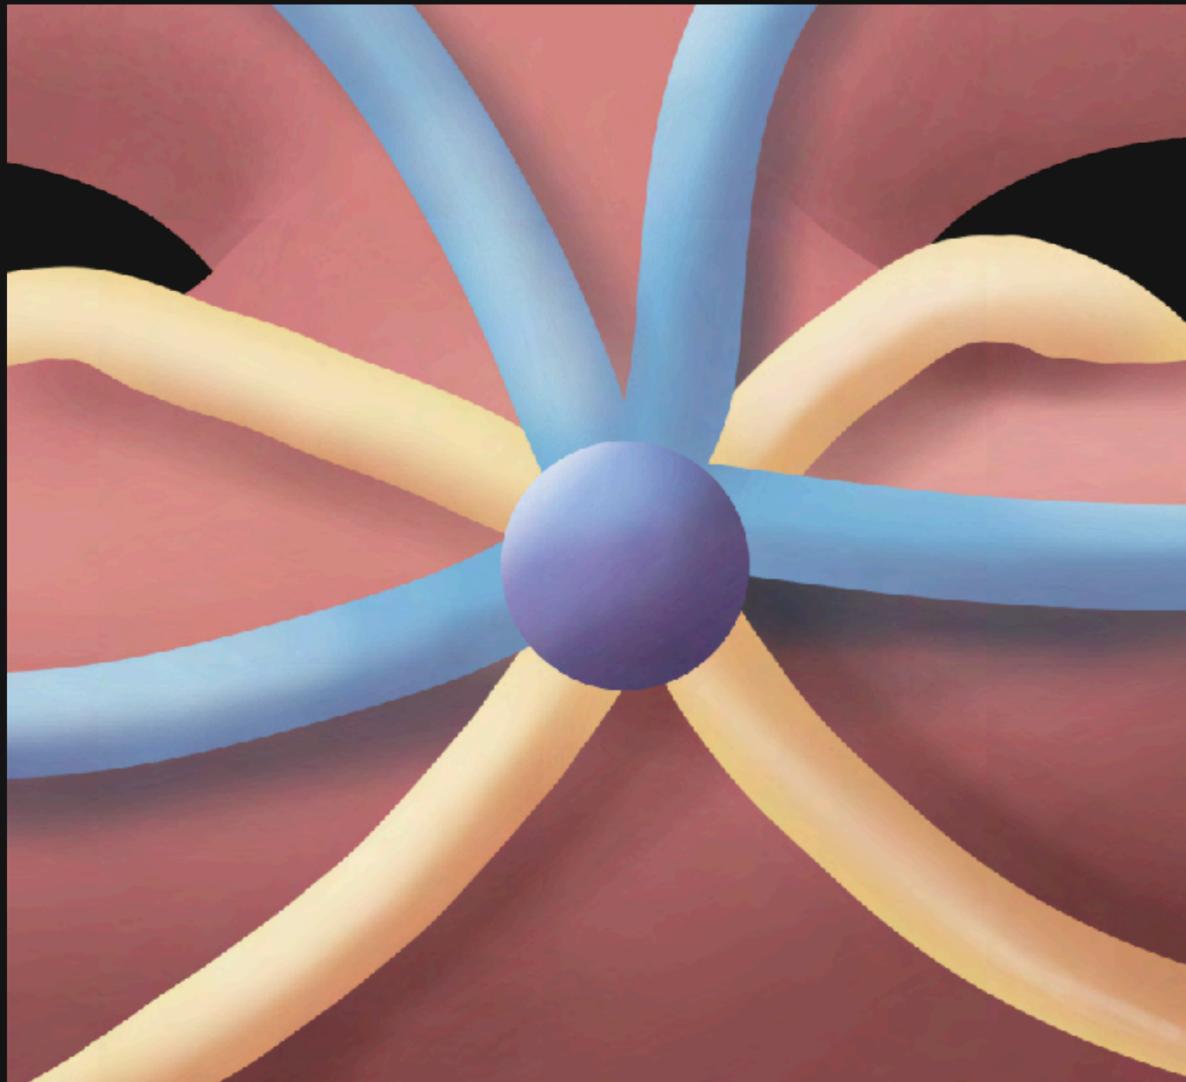

$$\langle a, b, c, d \mid aba^{-1}b^{-1}cdc^{-1}d^{-1} \rangle$$

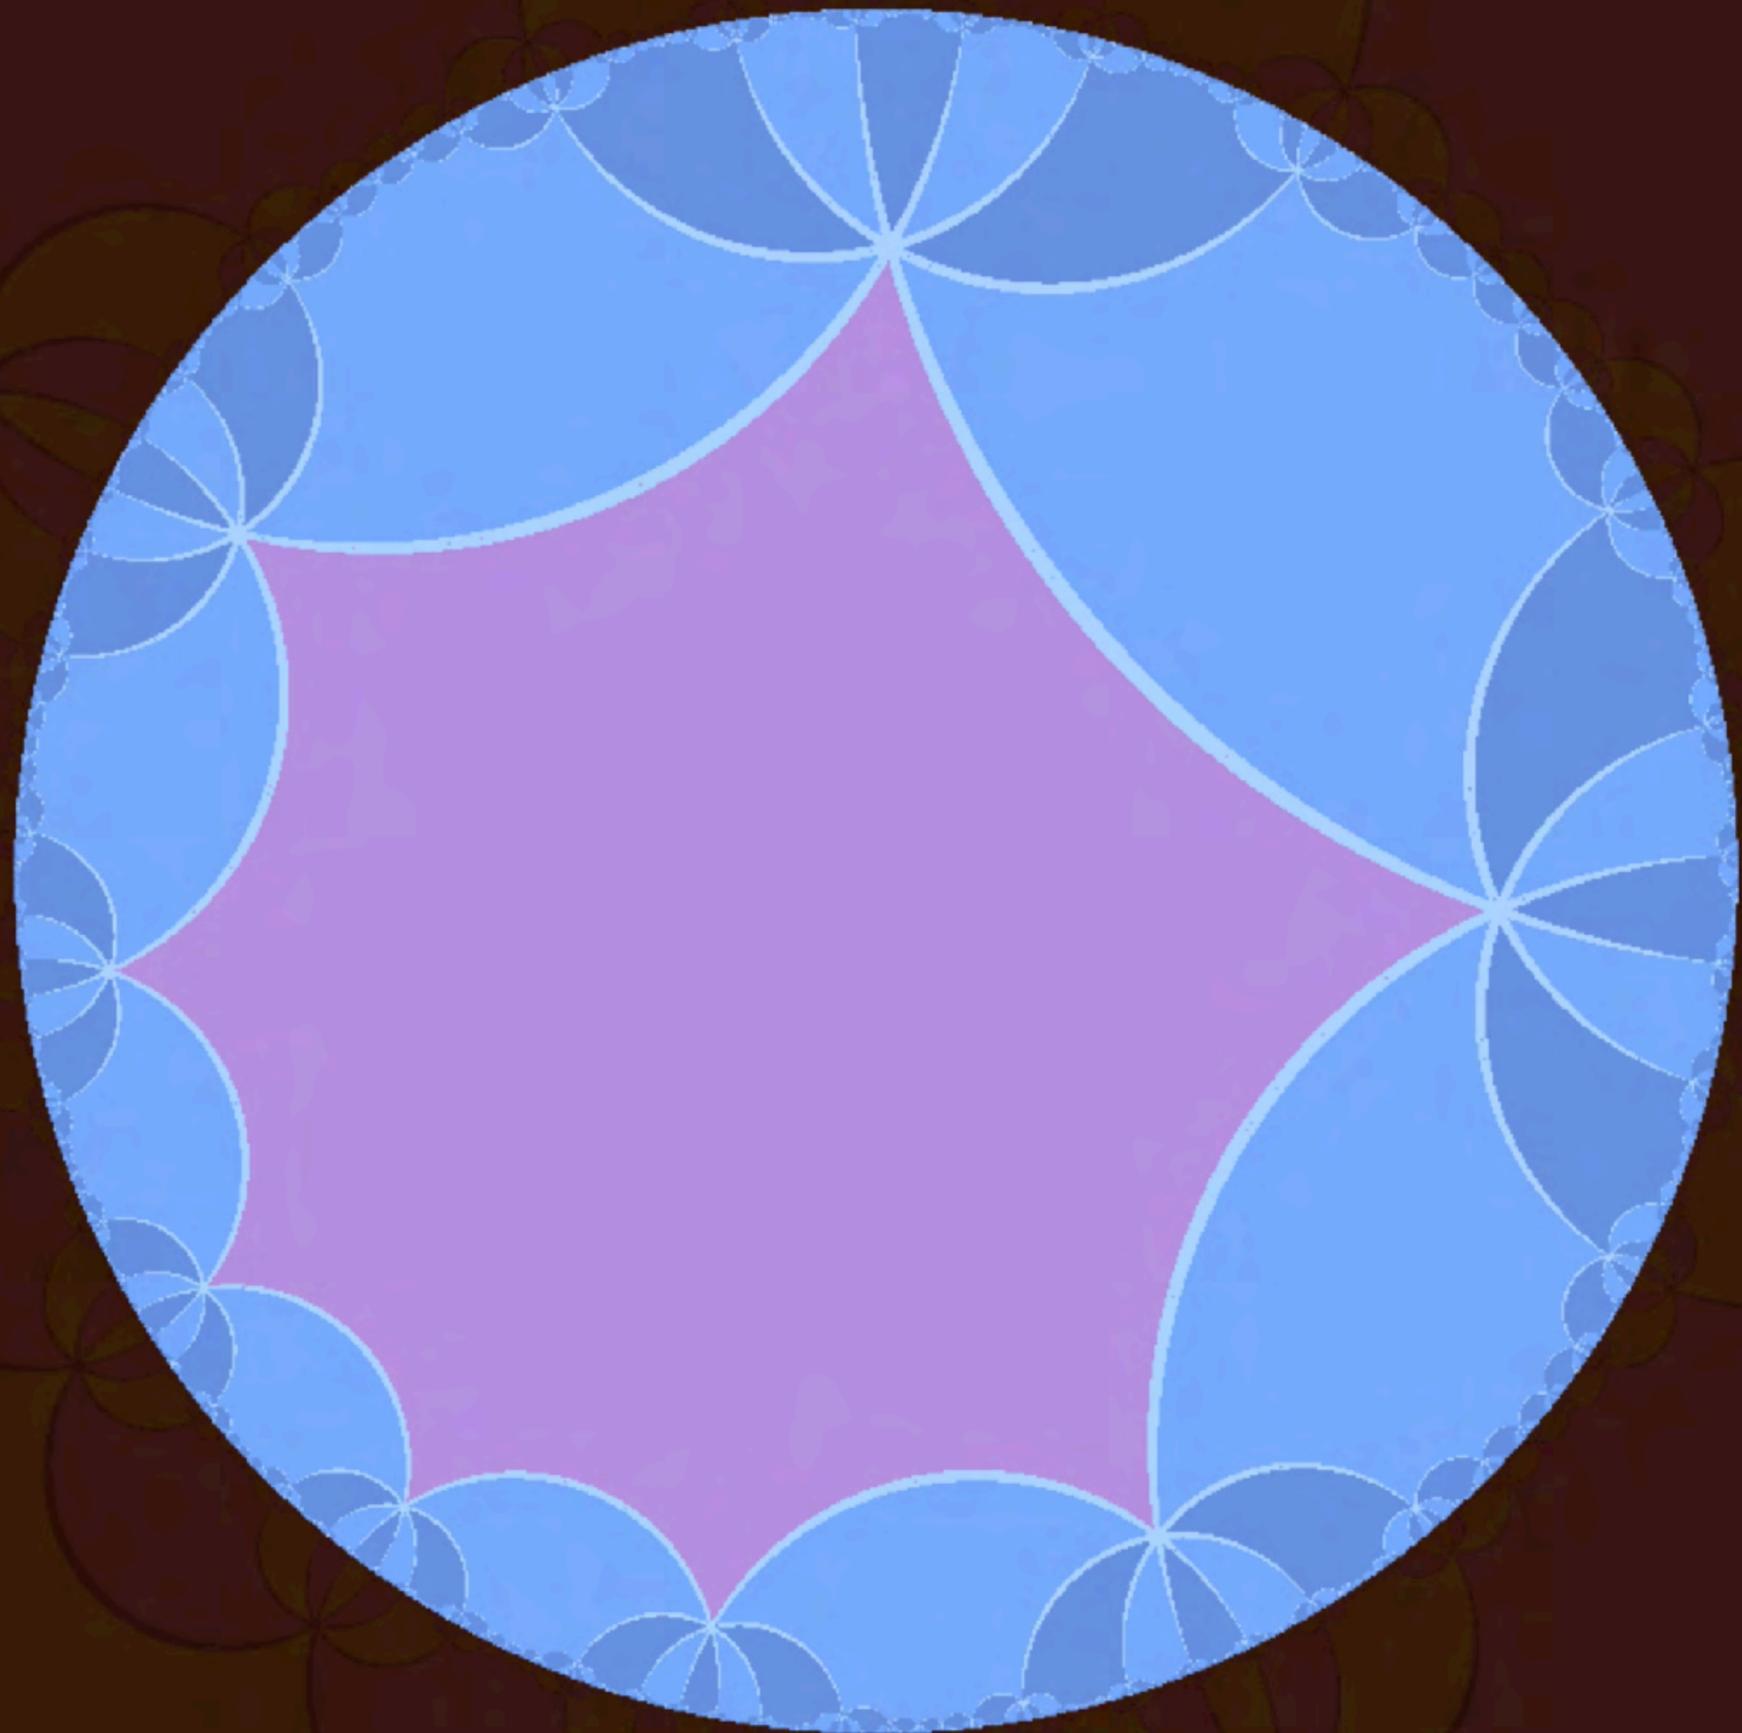

*Unrolling along all  
loops should produce  
**a tiling by octagons***

*How many octagons need to meet at each vertex?*

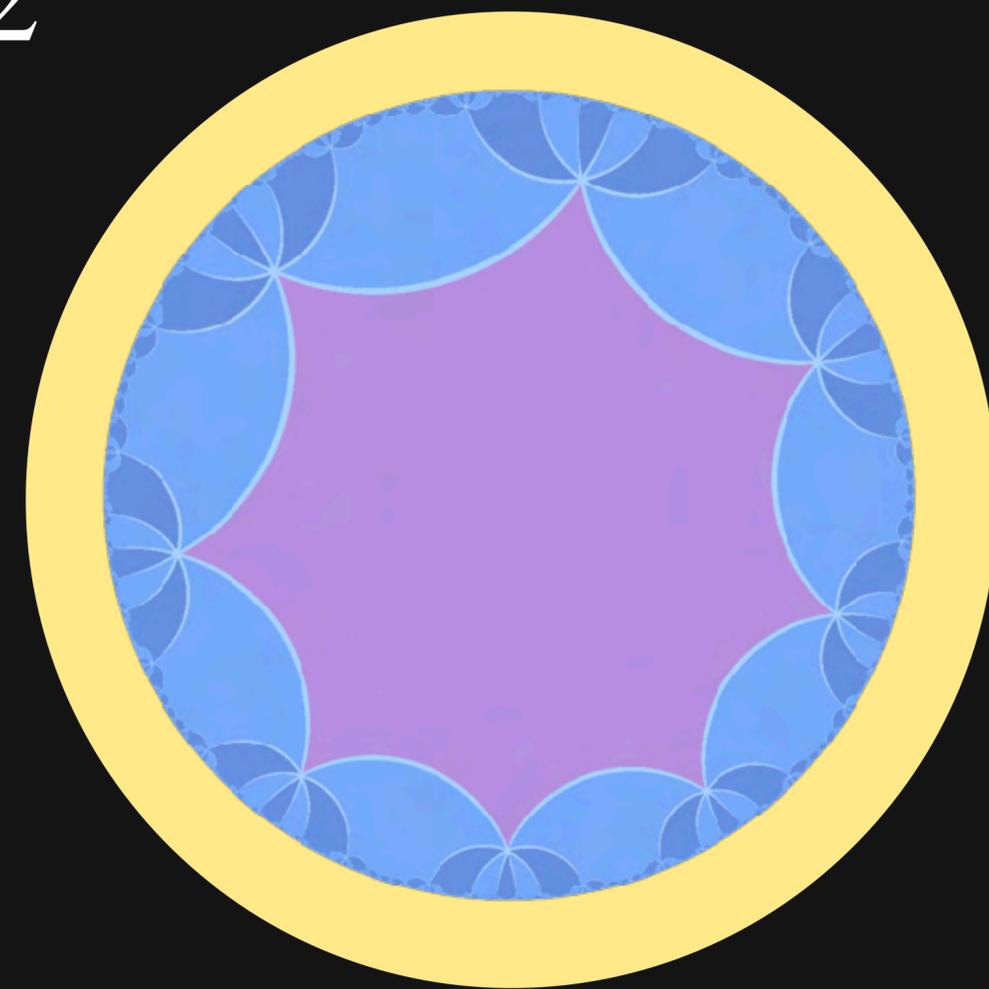

*Fitting eight octagons about a vertex requires  
**hyperbolic geometry!***

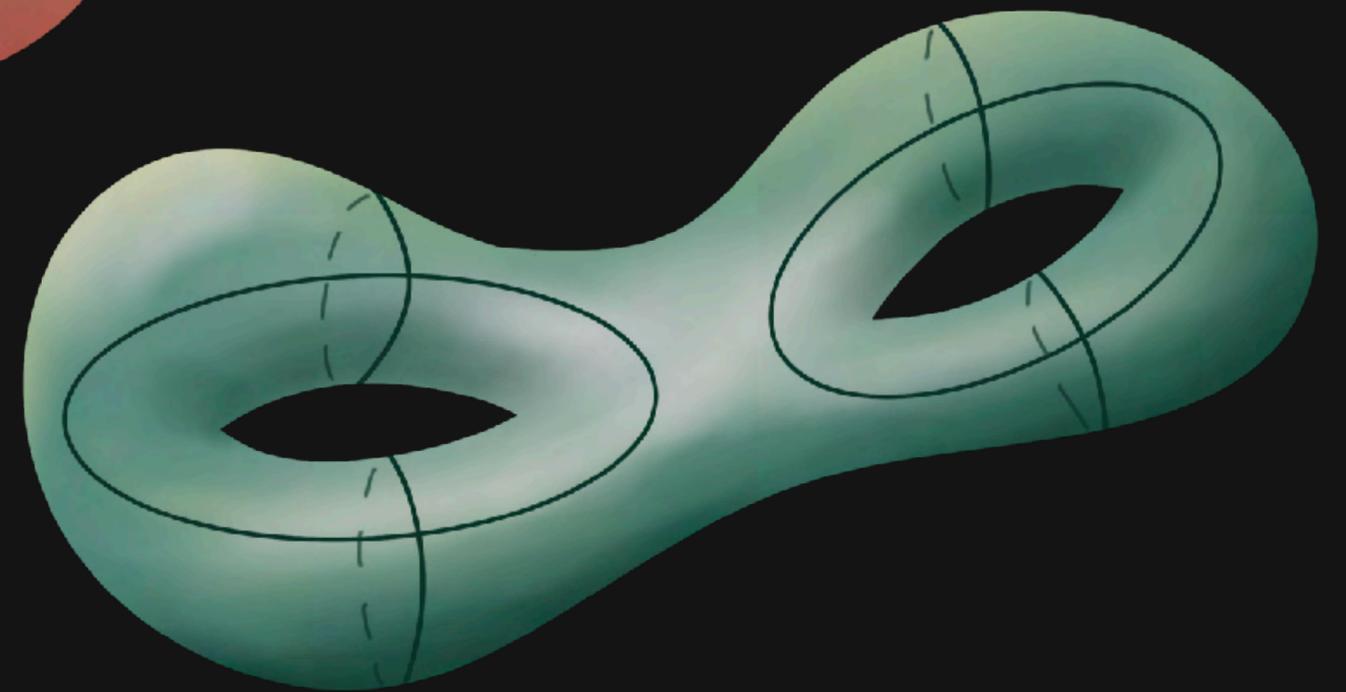

$\pi_1 \Sigma_2 \cong \langle a, b, c, d \mid [a, b][c, d] \rangle$   
**acts geometrically on  $\mathbb{H}^2$**

**So  $\pi_1 \Sigma_2$  is QI to  $\mathbb{H}^2$ , and its  
boundary is homeomorphic  
to  $\partial \mathbb{H}^2 \cong S^1$**

# What about Higher Genus?

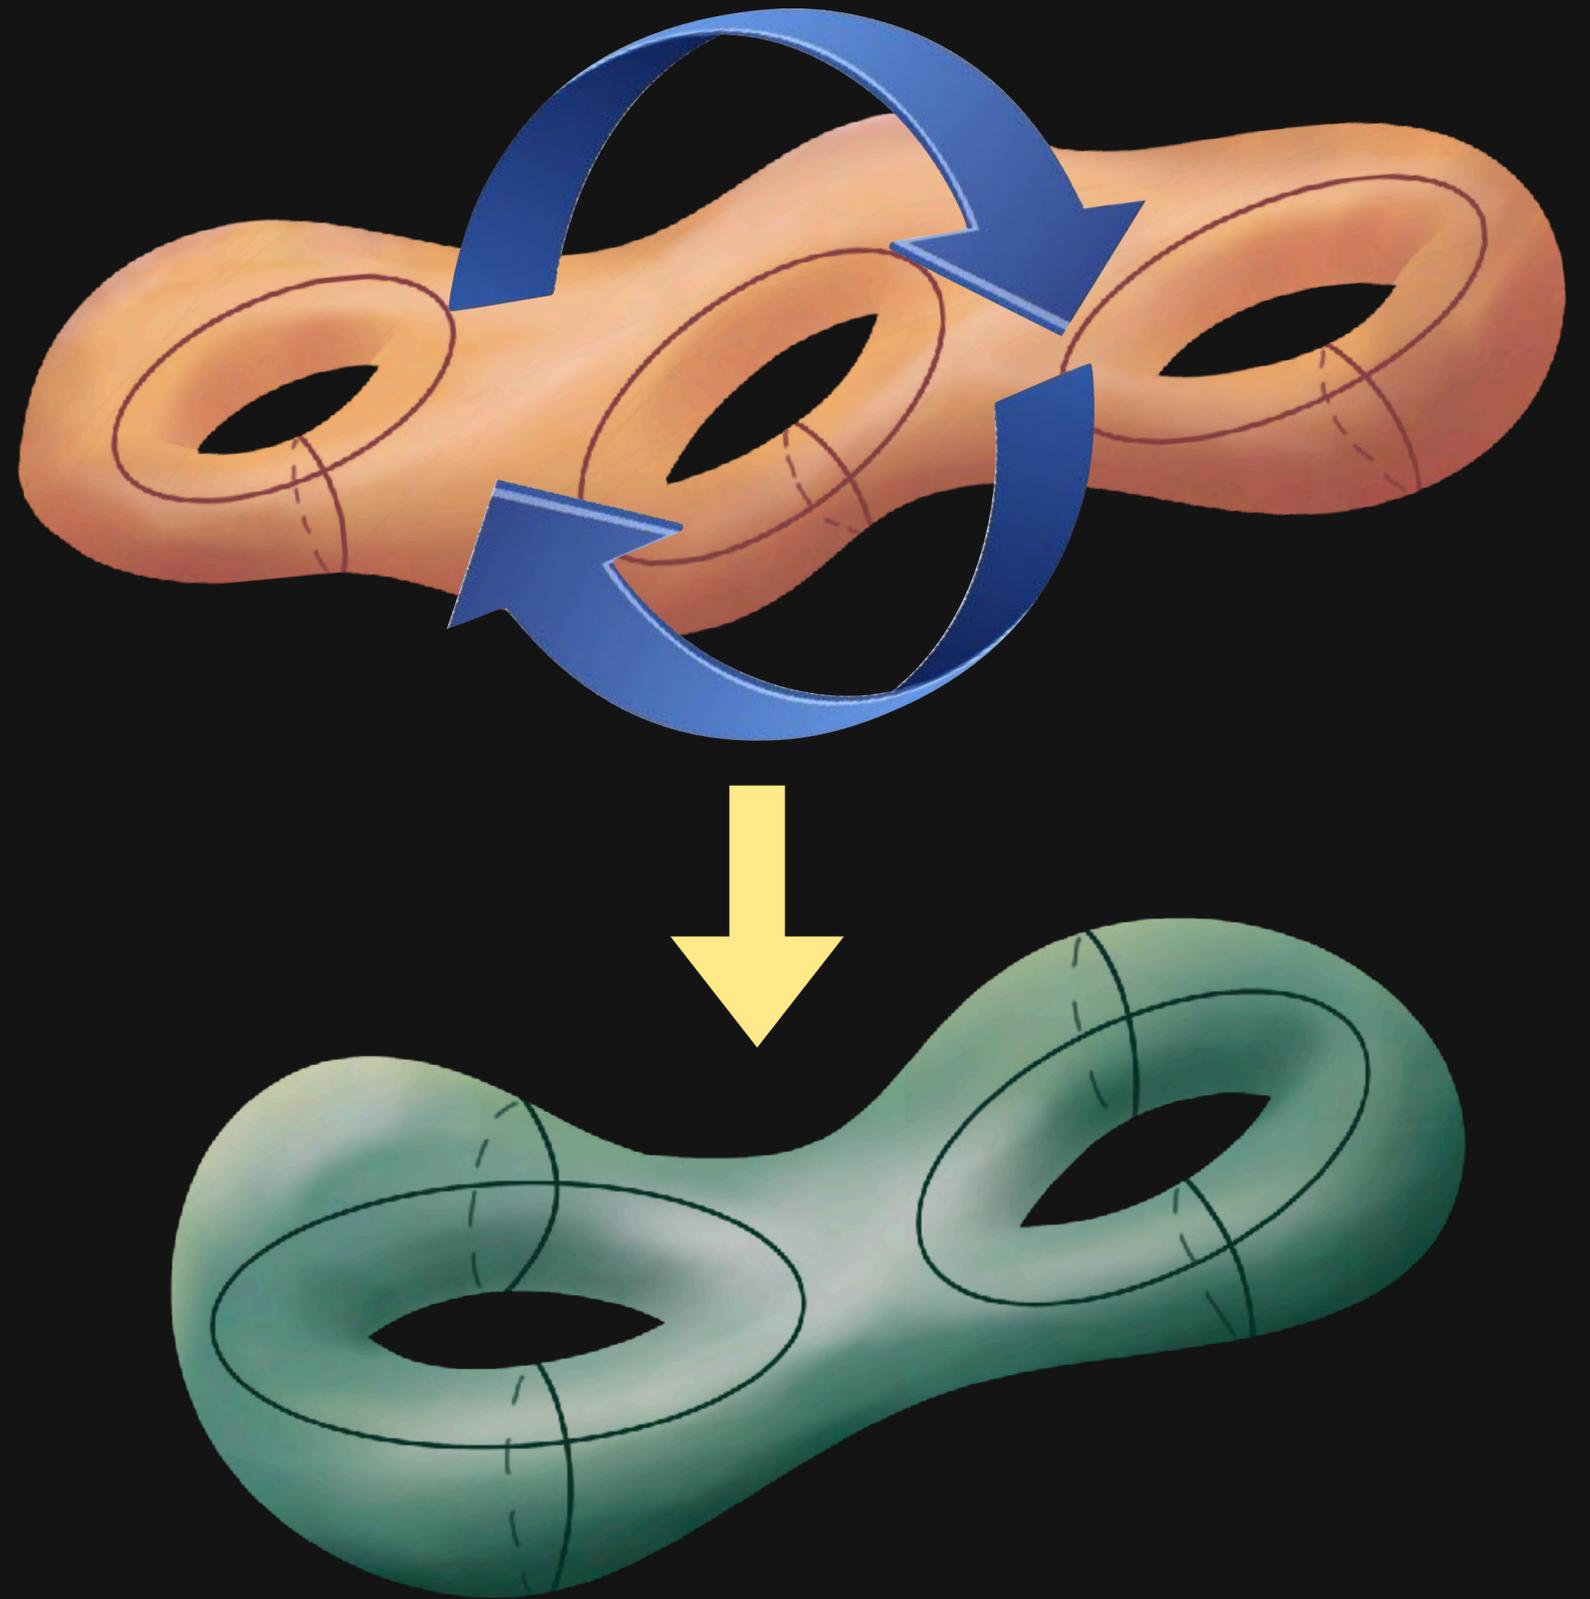

## Genus?

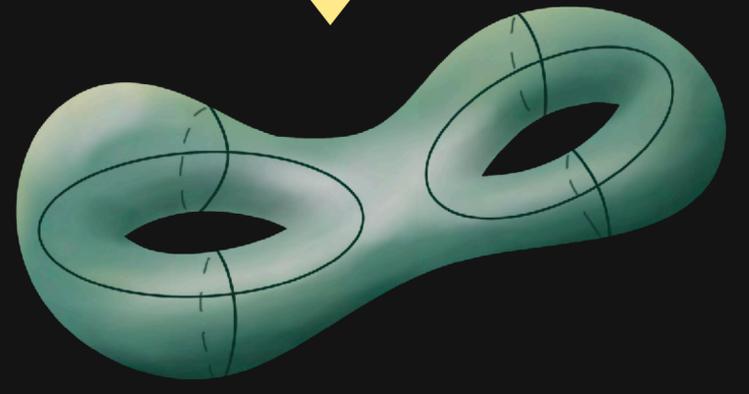

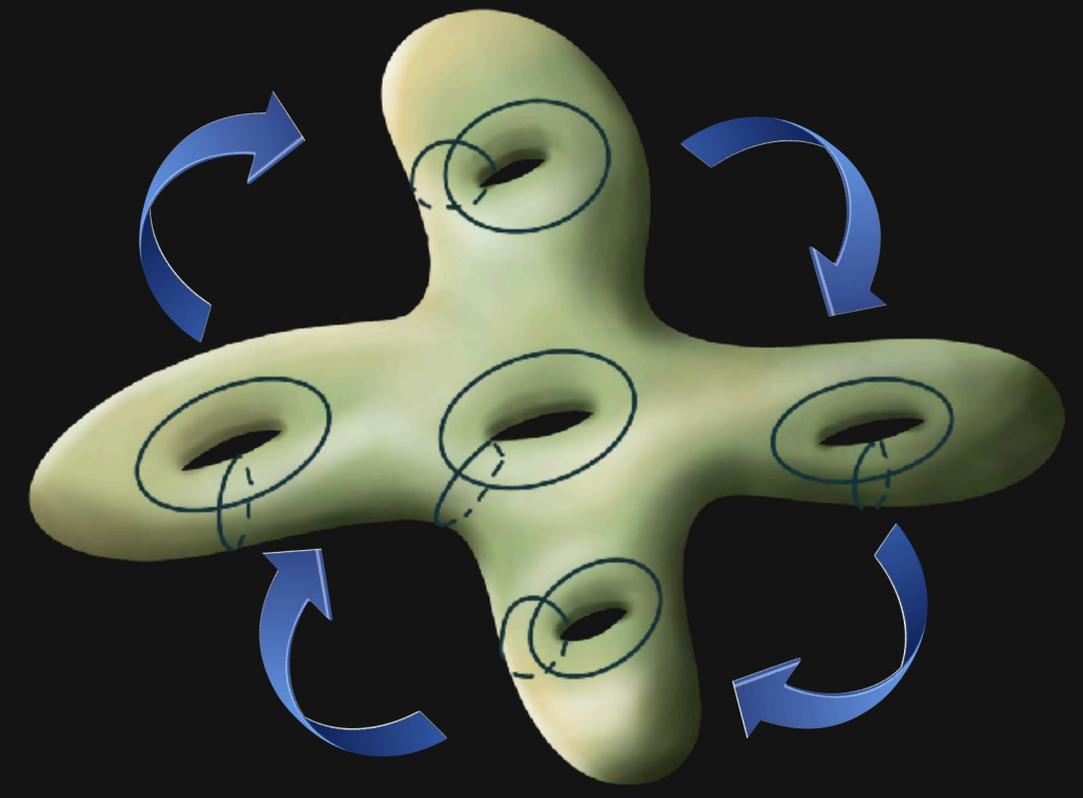

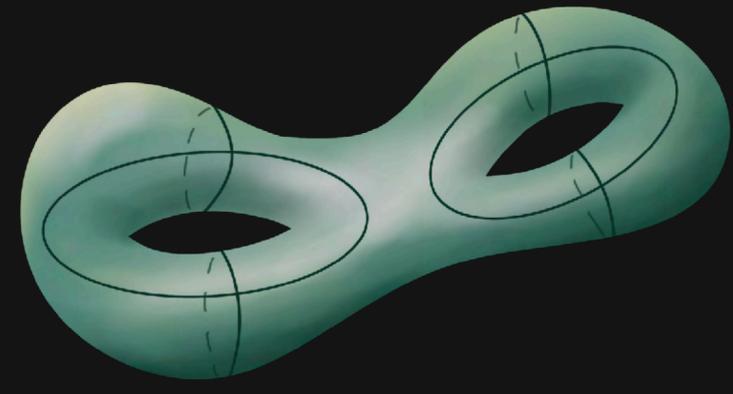

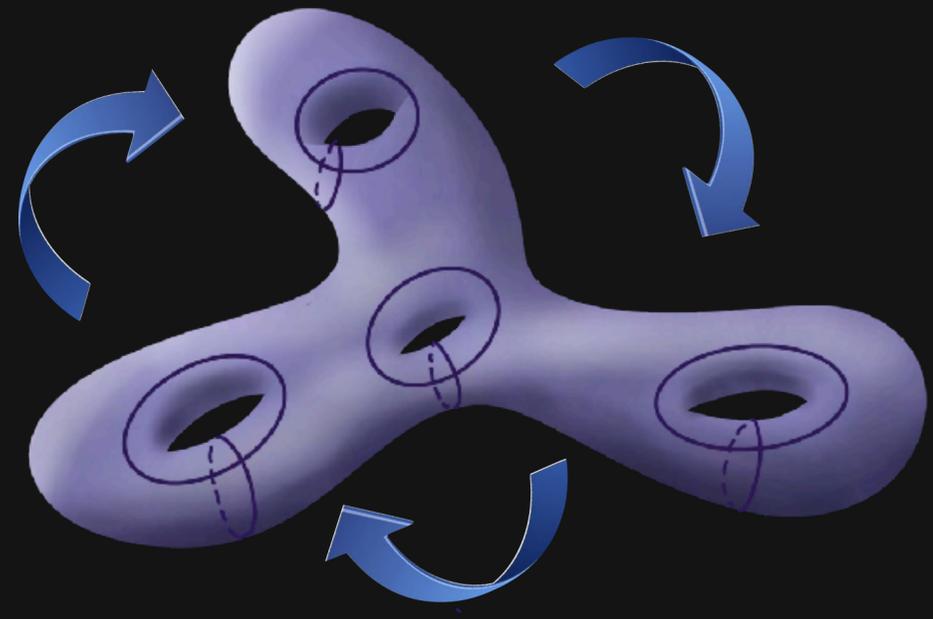

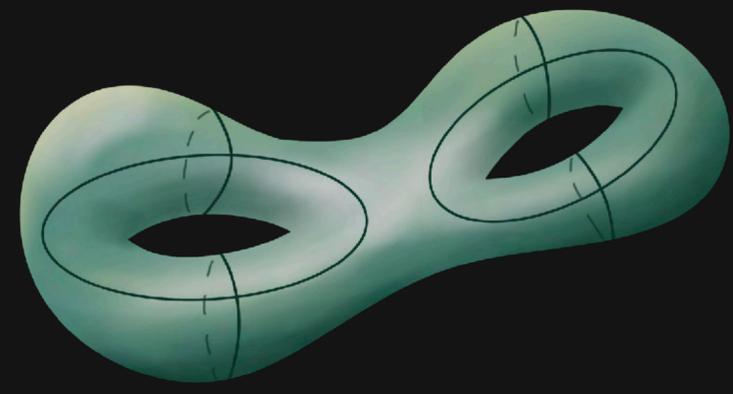

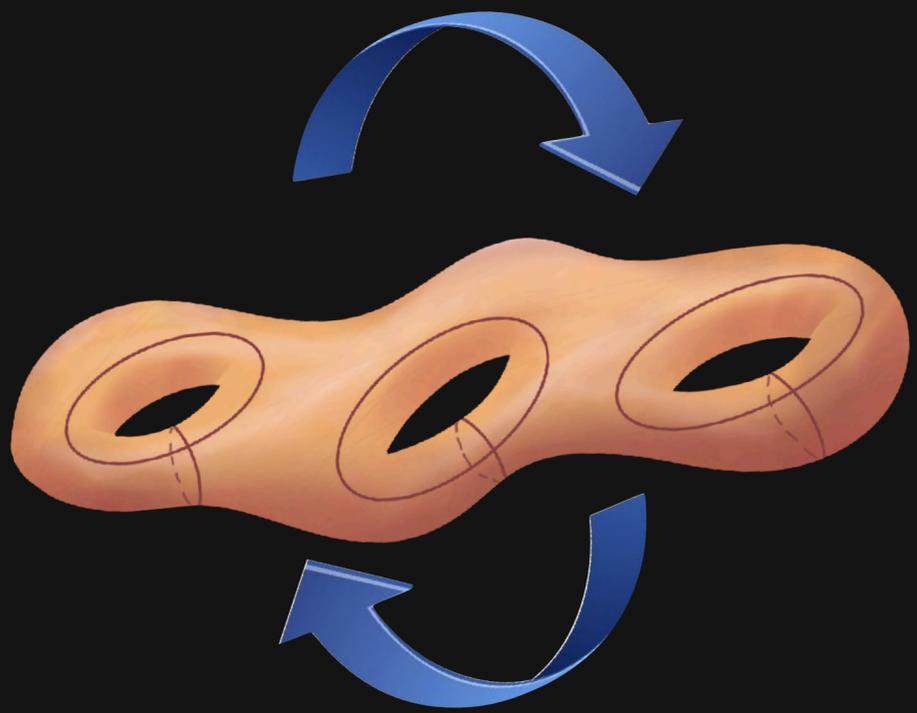

**Genus  $g$**

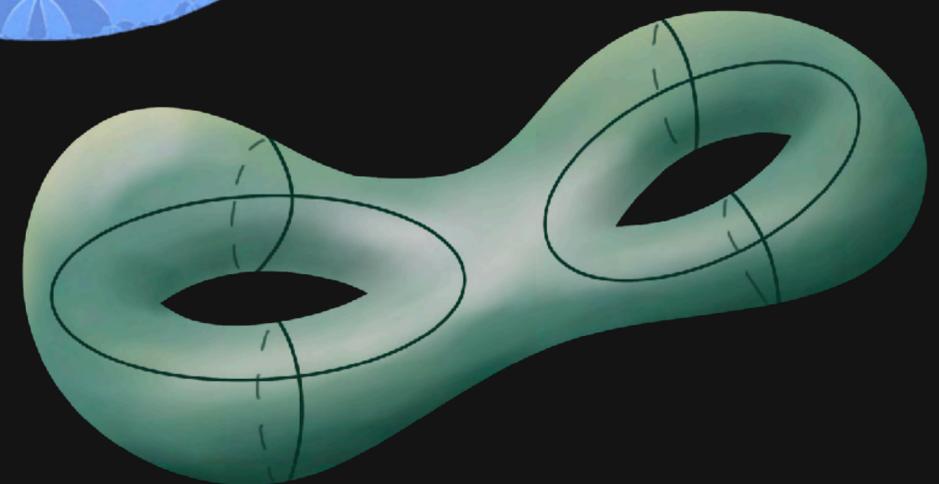

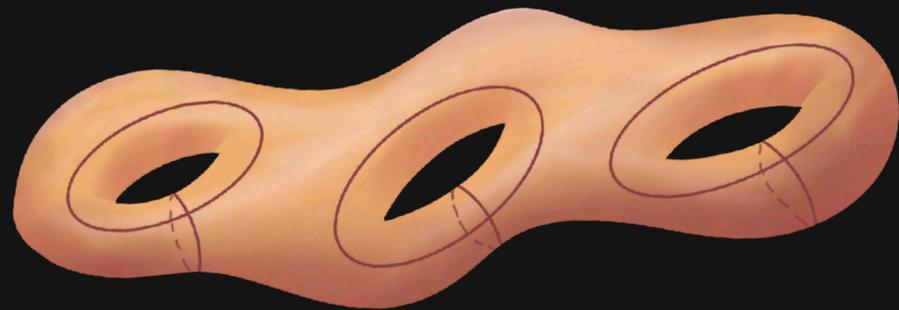

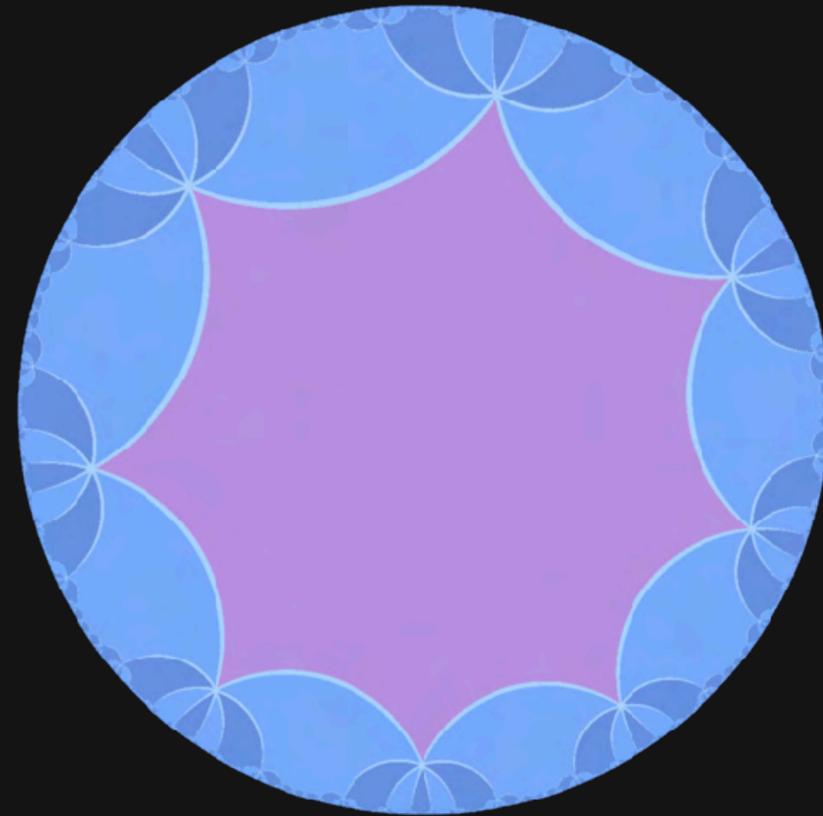

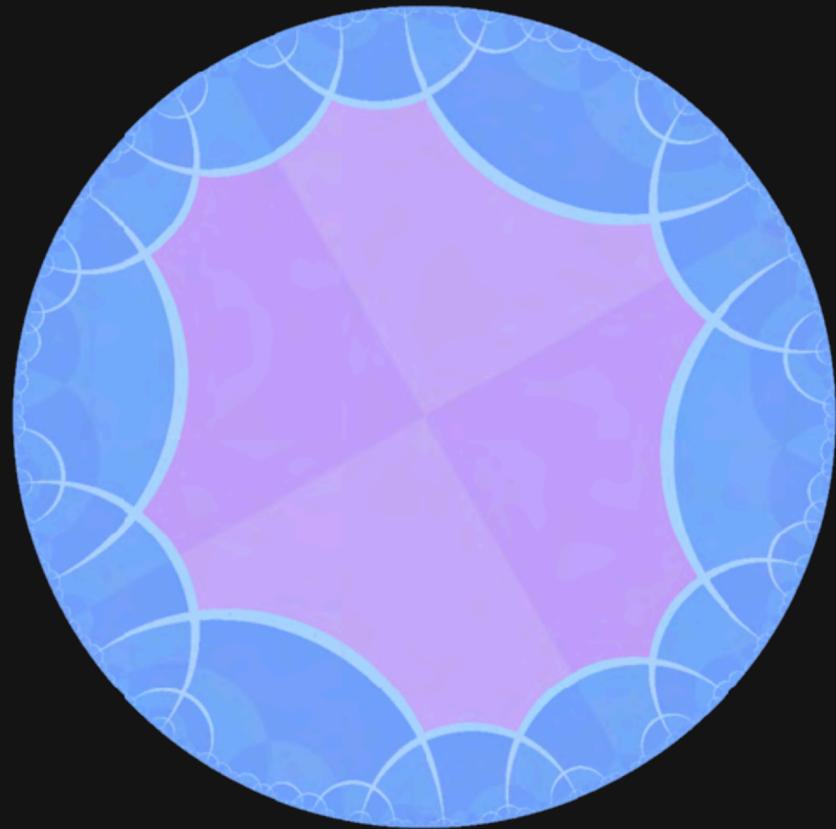

**Covers**

**Genus 2**

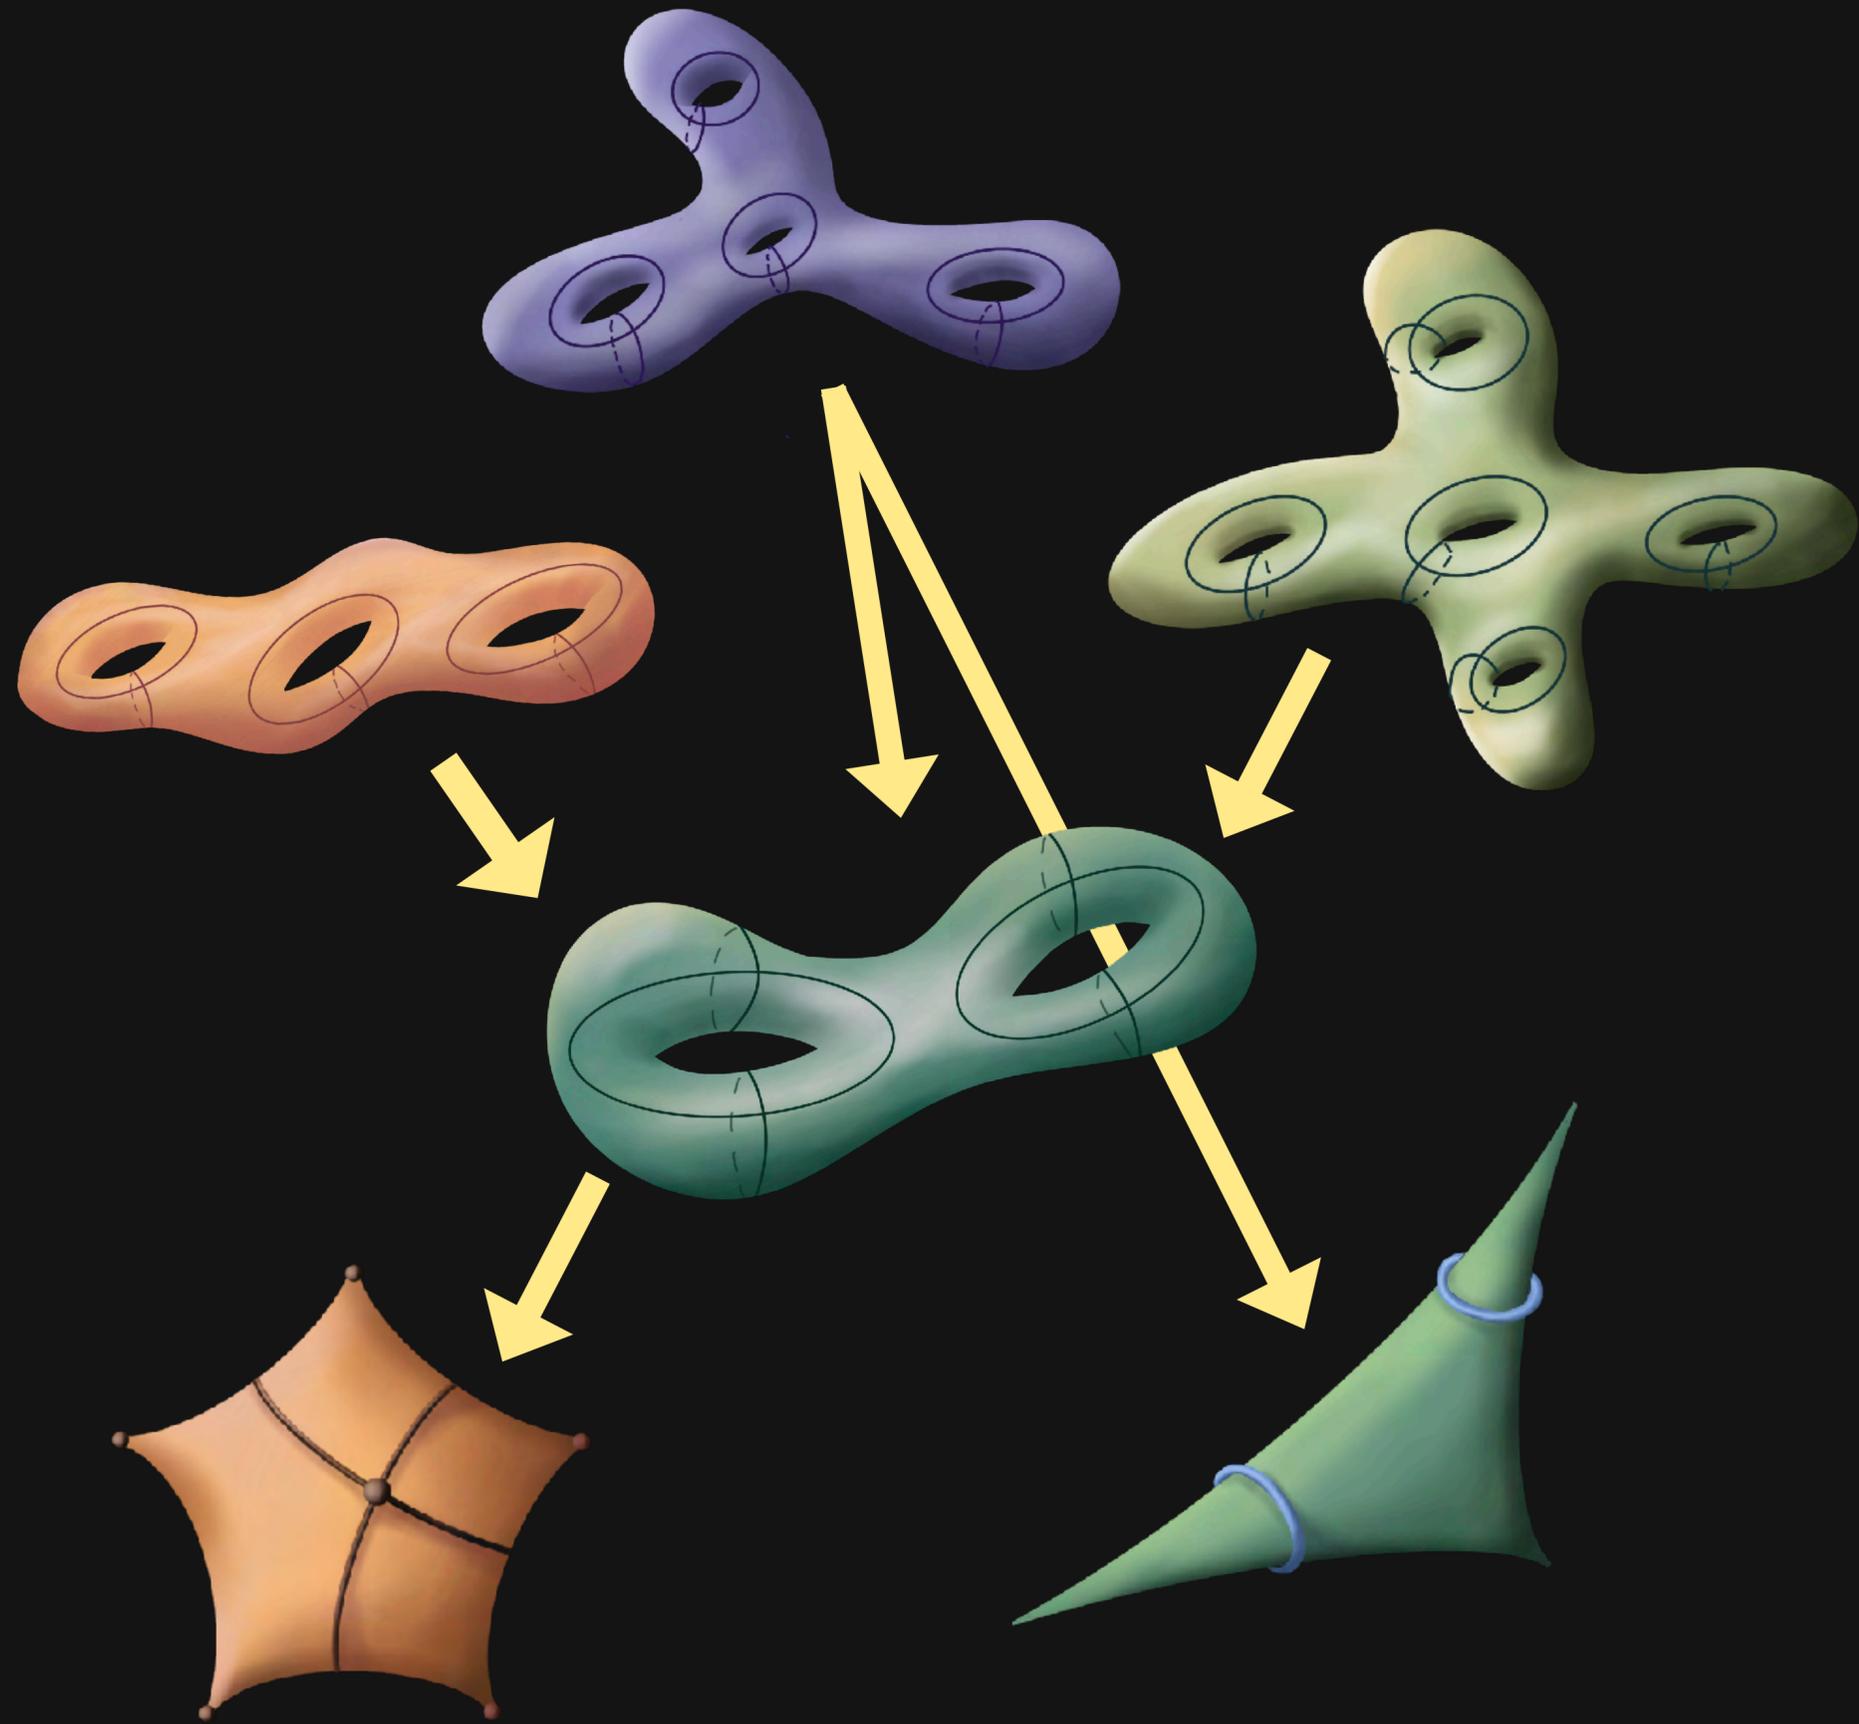

**All surface groups of genus  $g > 1$  are QI to the hyperbolic plane**

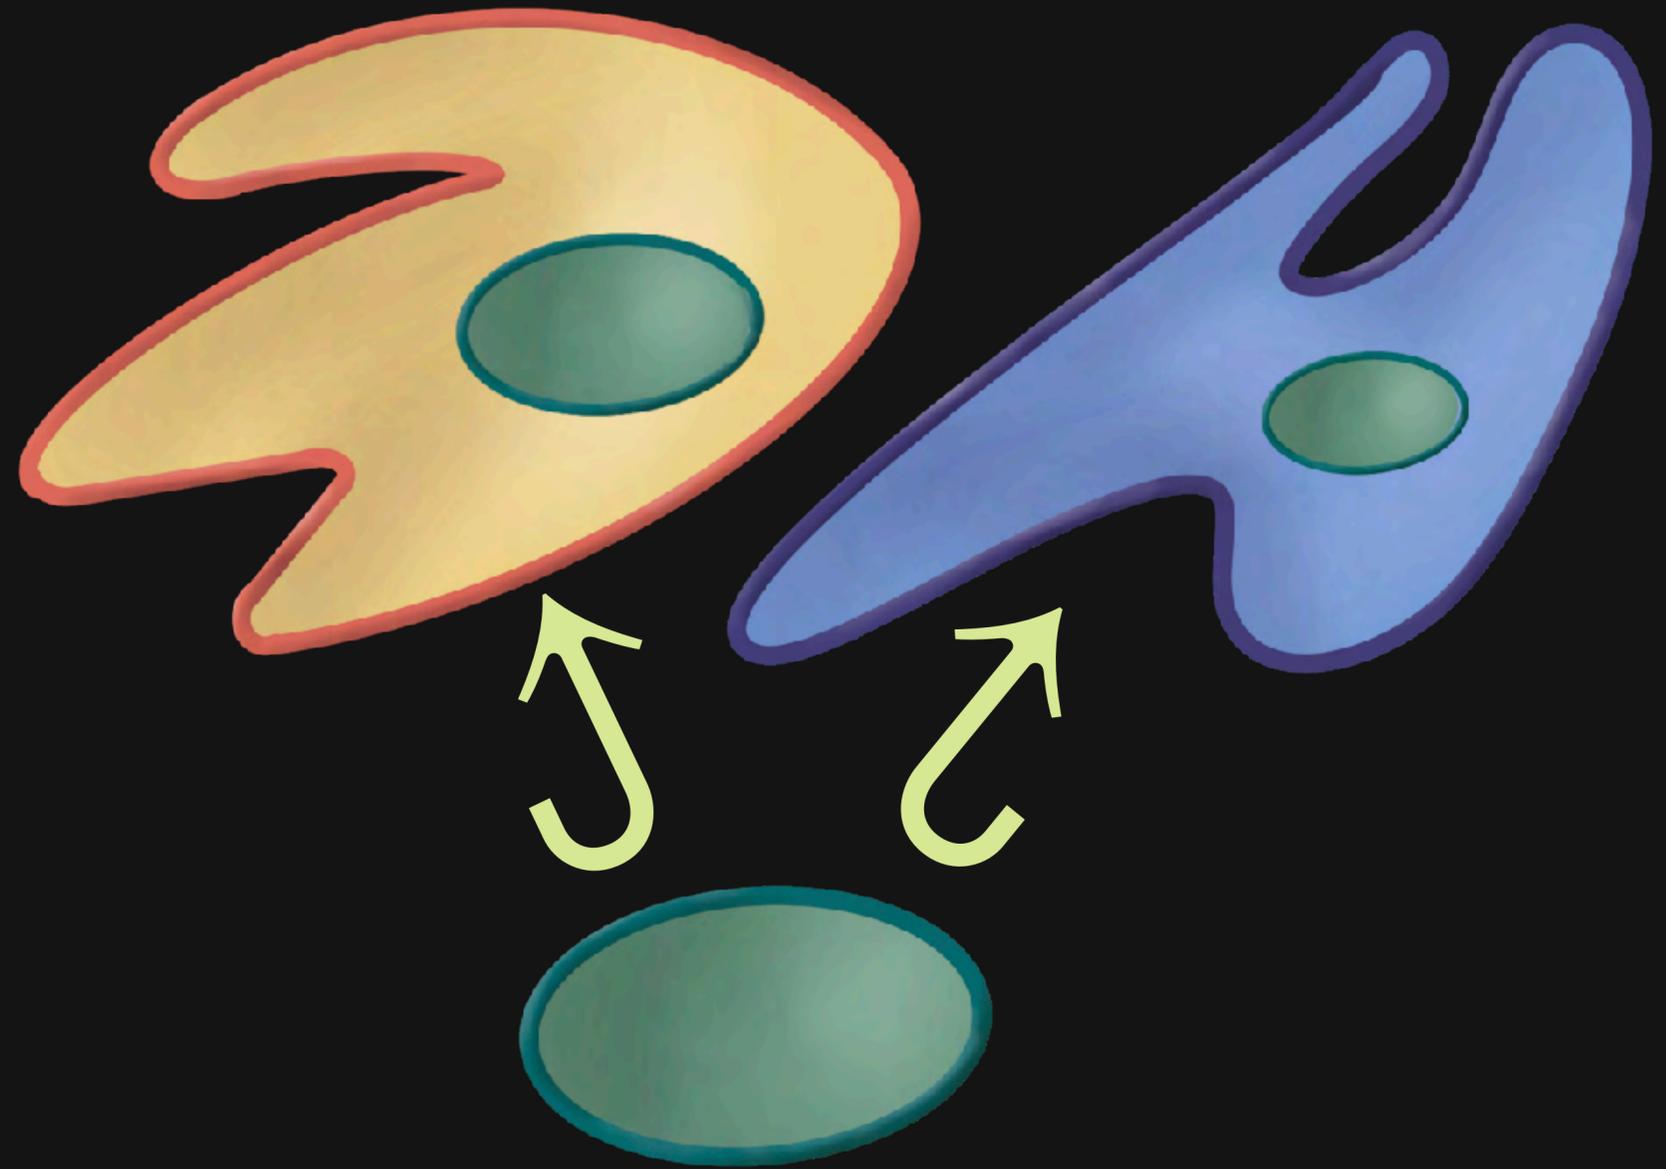

**This is  
really one  
example:**

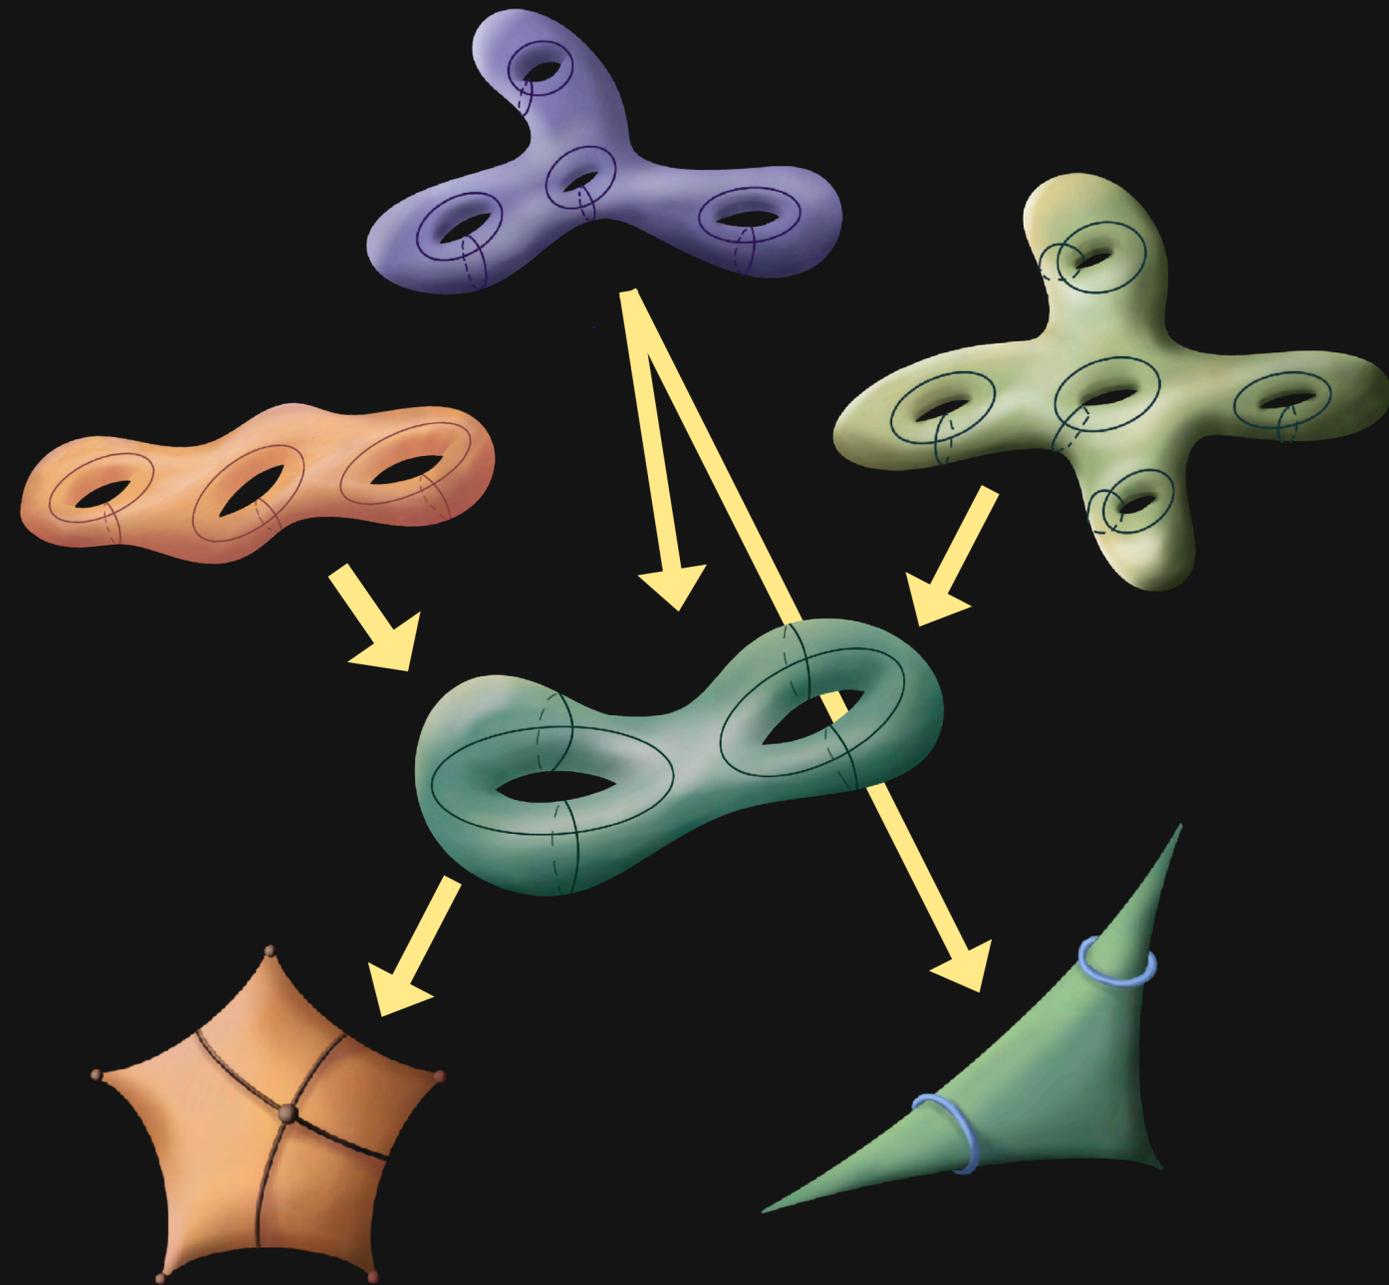

# Commensurability

Groups are  
(abstractly)  
commensurable  
if they share a  
finite index  
subgroup

# Commensurability

**Groups are  
(abstractly)  
commensurable  
if they share a  
finite index  
subgroup**

**This is the ONLY  
example!**

**Tukia Gabai Freden Casson Jungreis, 1988**

**A hyperbolic group has boundary  $\mathbb{S}^1$  if  
and only if it's one of these.**

**Groups with boundary**

**The 2-Dimensional**

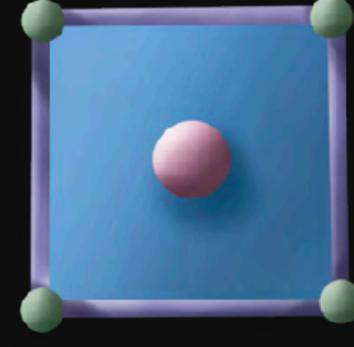

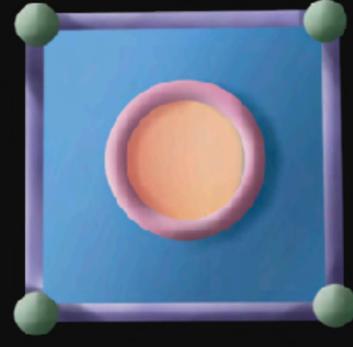

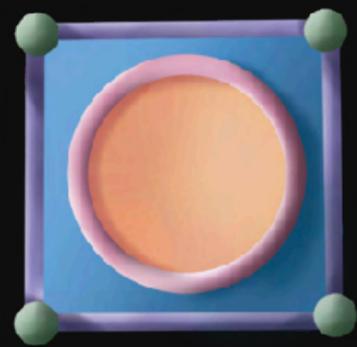

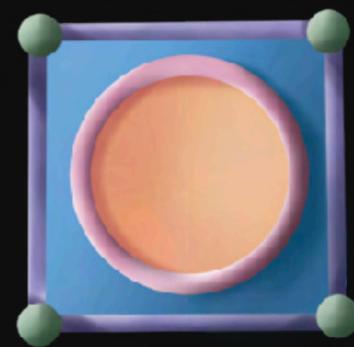

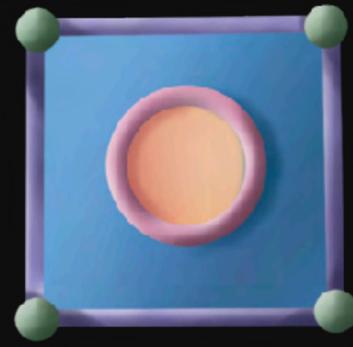

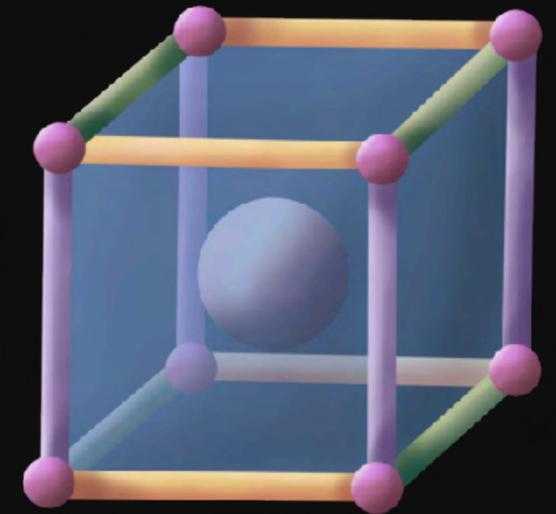

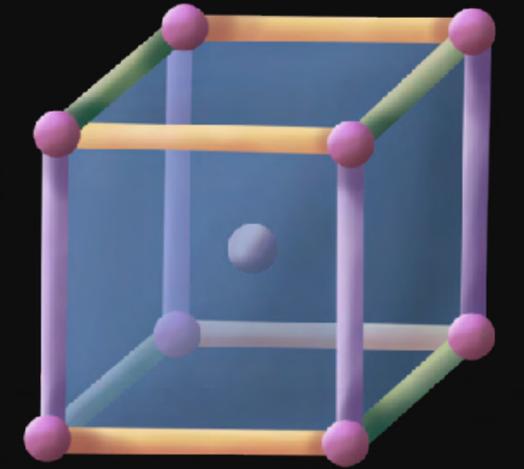

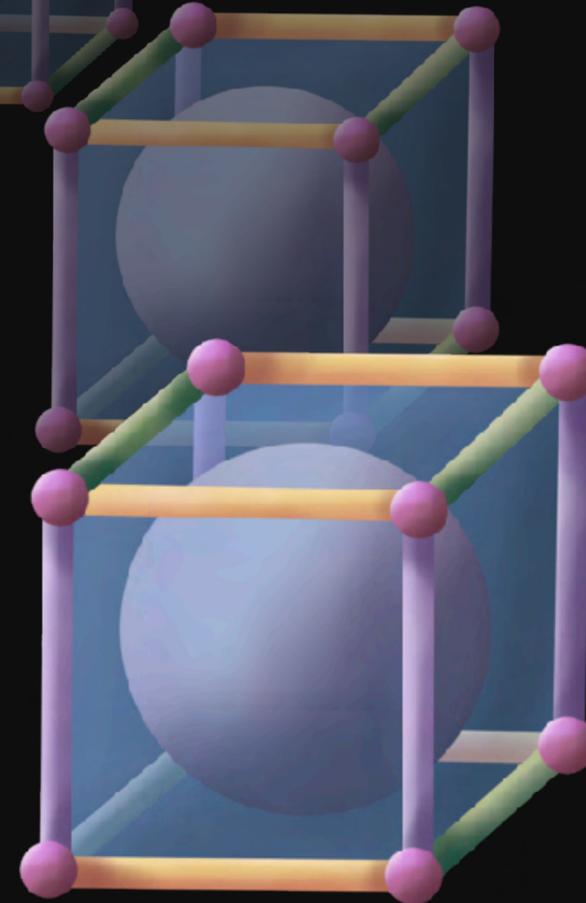

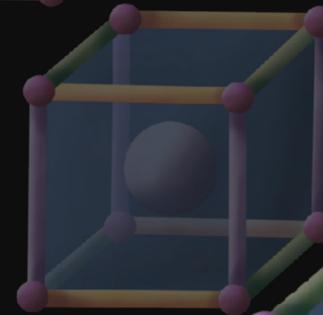

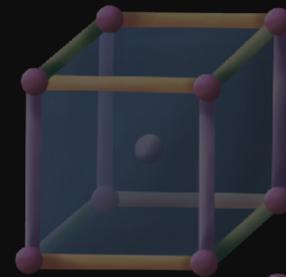

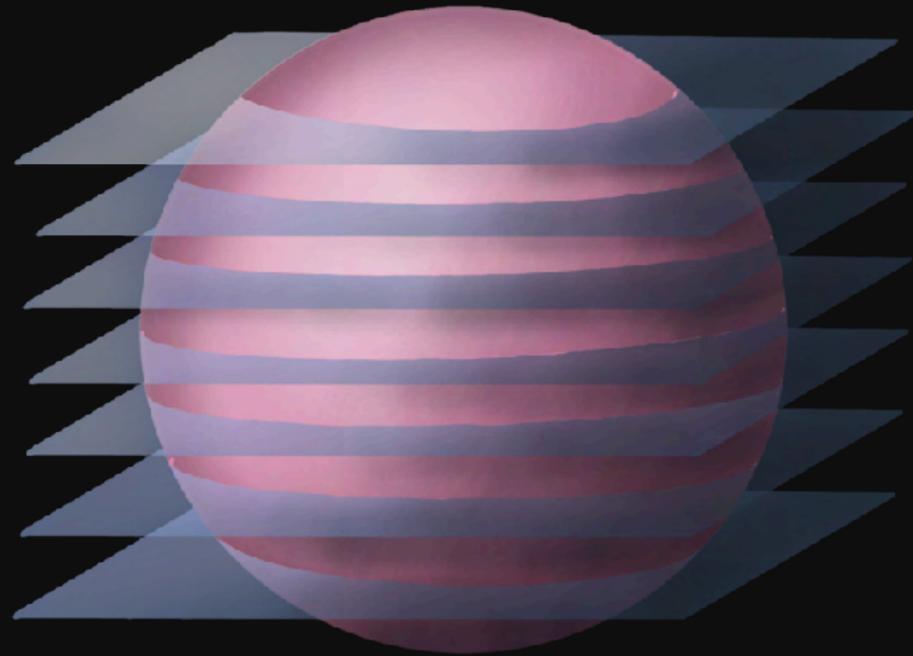

**Sphere**

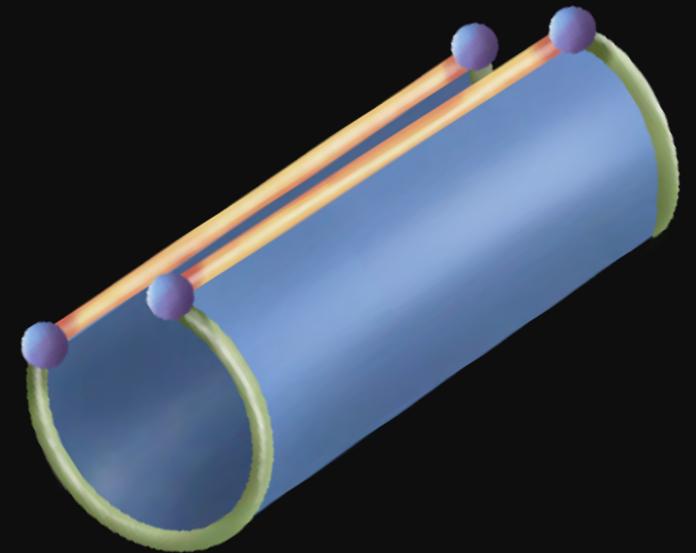

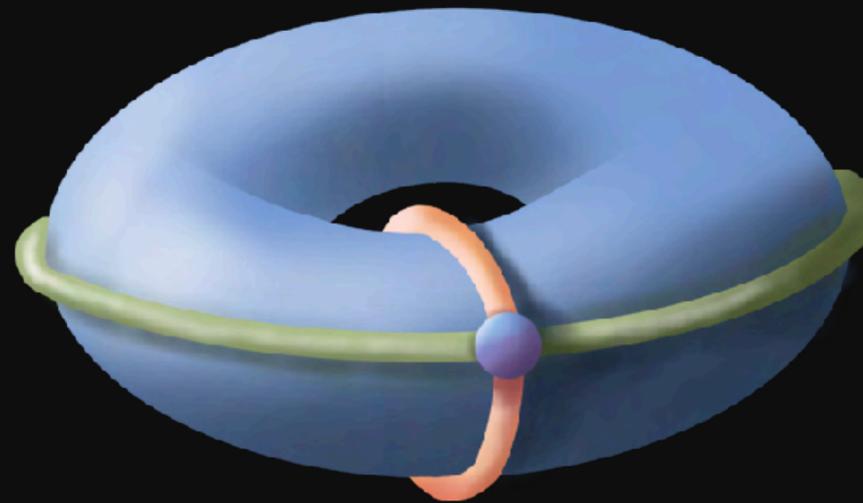

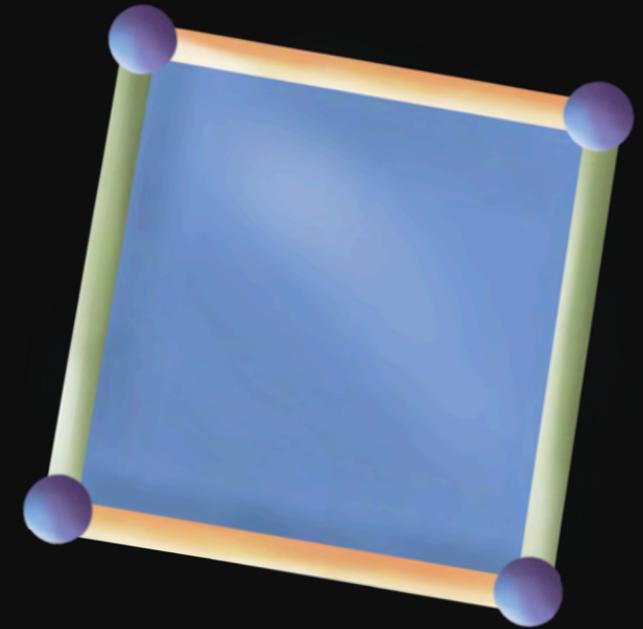

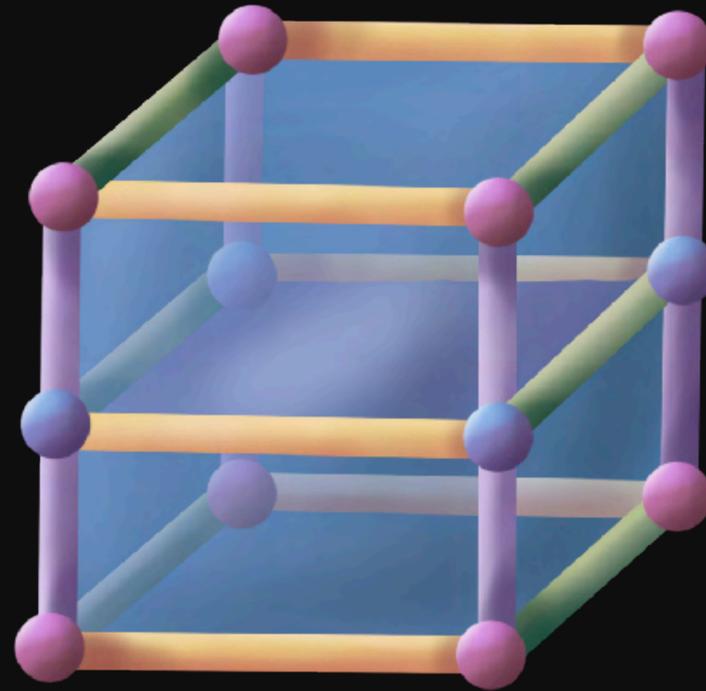

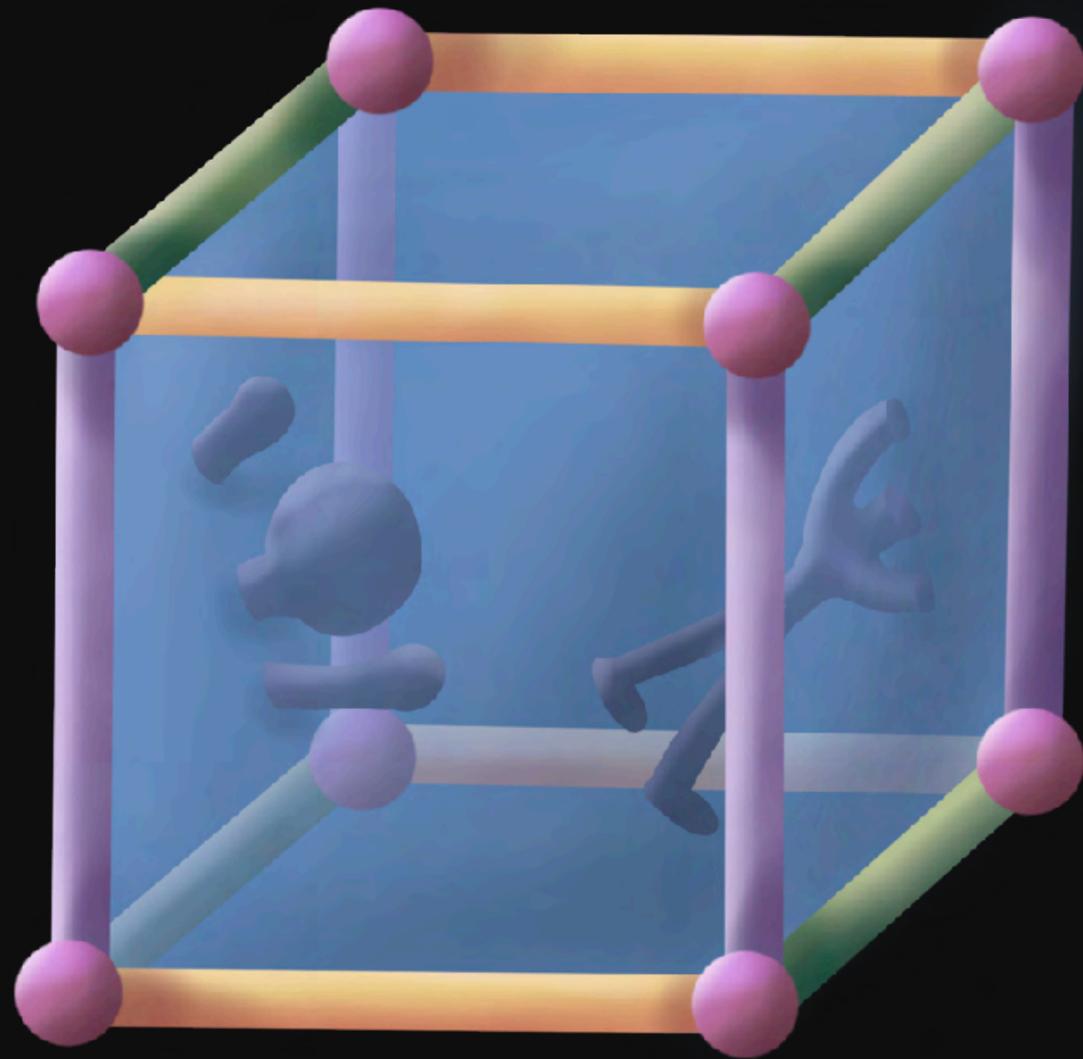

**Where do we start?!?!**

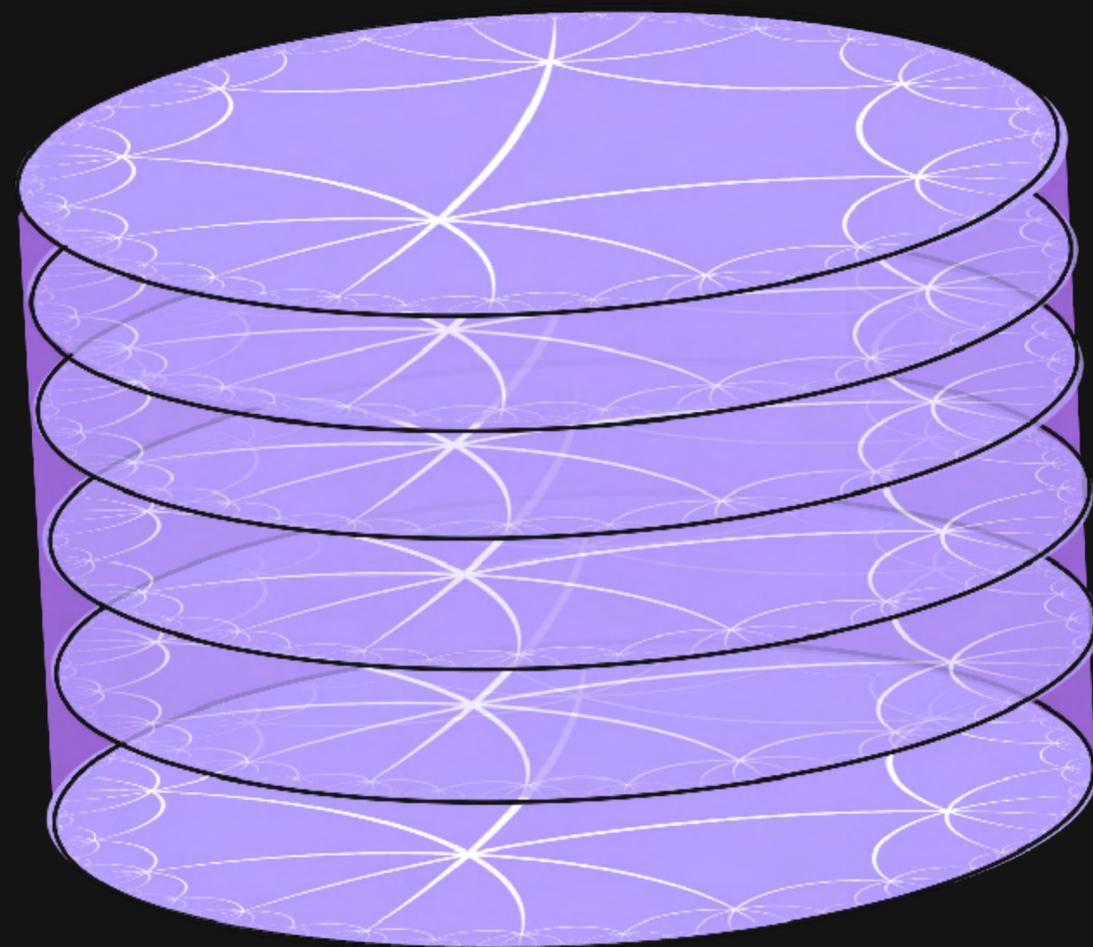

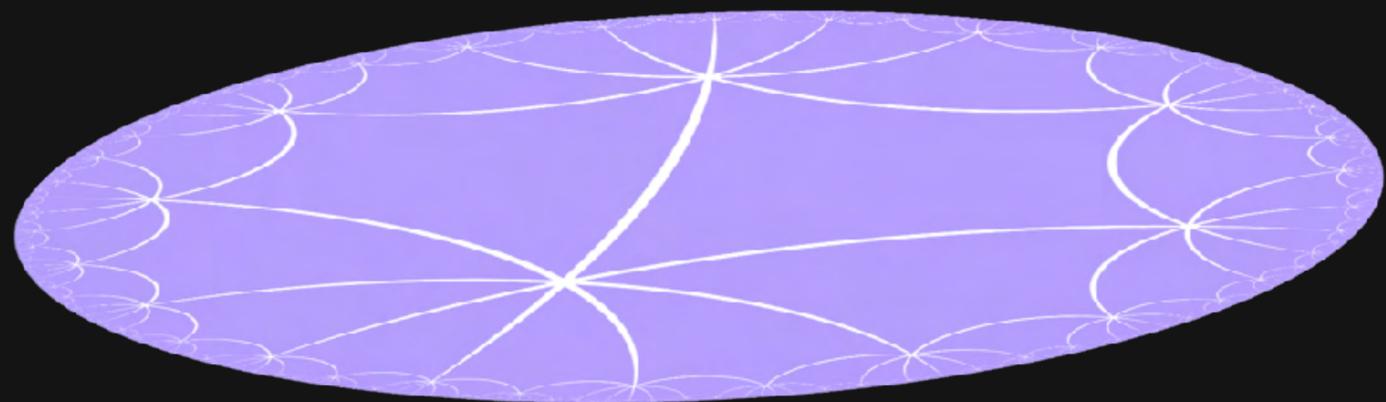

**In 2D we started with a nice  
shape we knew....do we  
know nice shapes here?**

# The 3 Sphere

# The 3-Torus

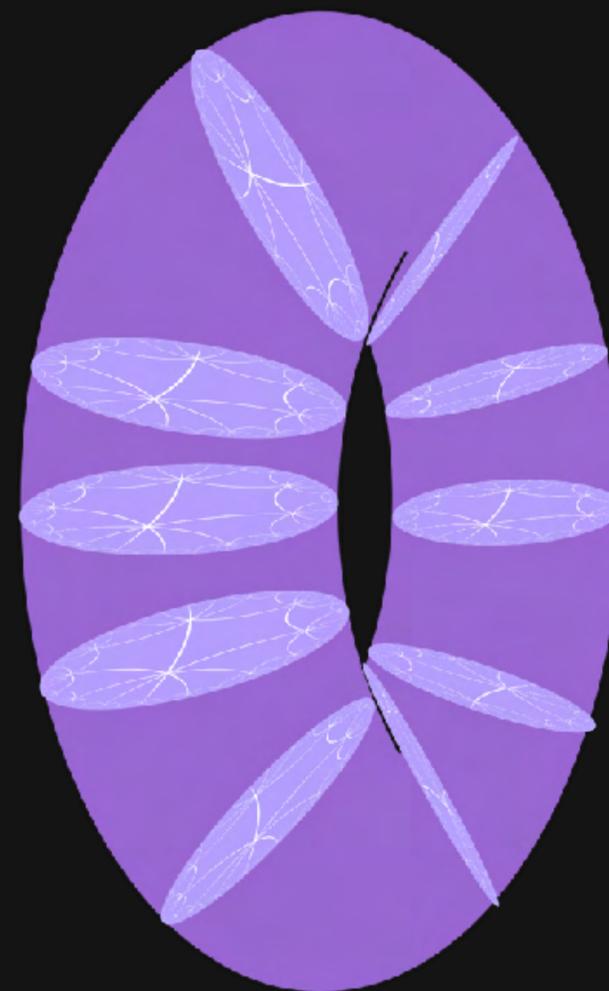

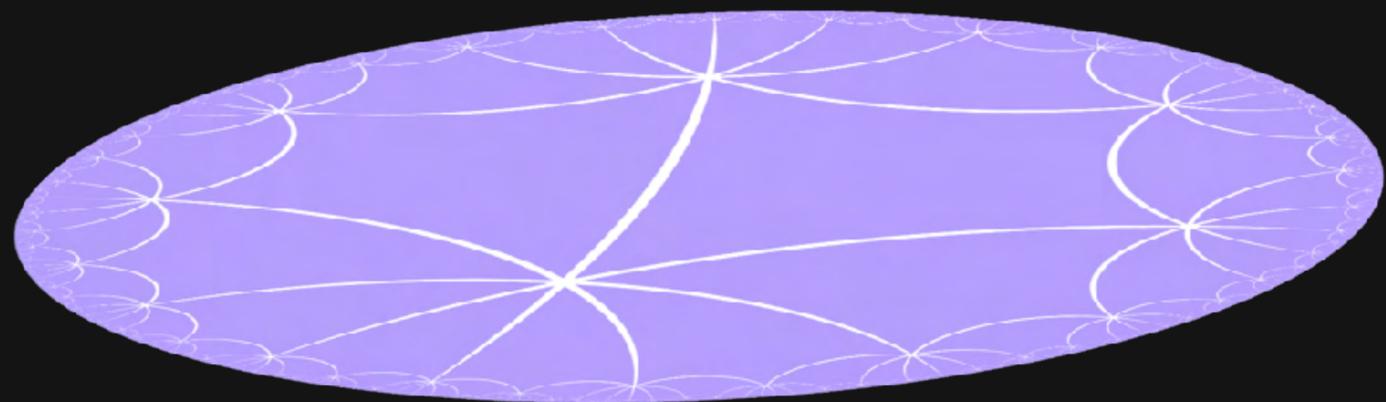

$\Sigma_{\infty}$

$\Sigma_{\infty} \times S^1$

$\Sigma_g$

$UT(\Sigma_g)$

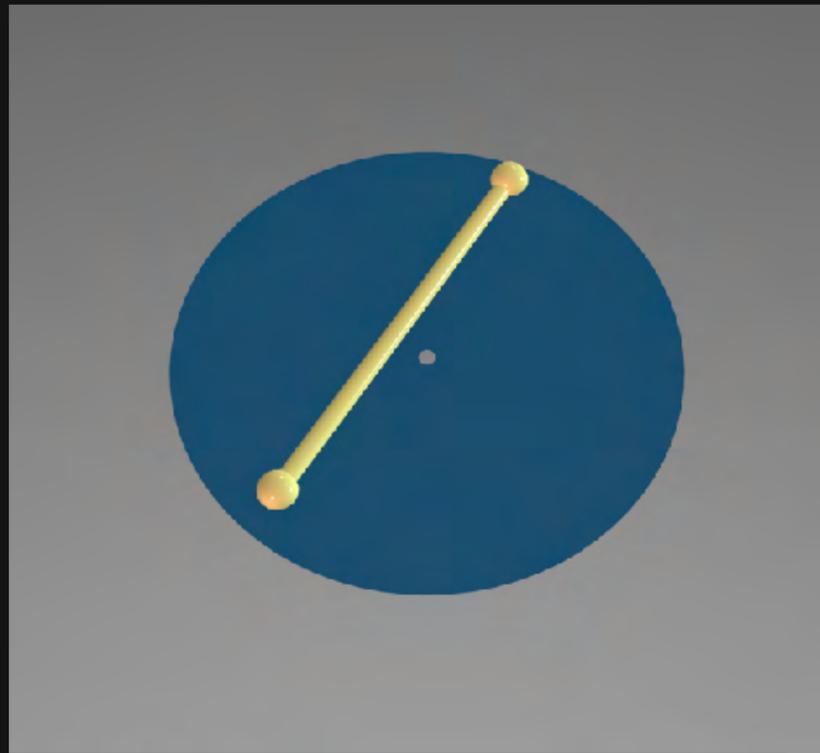

**How do we find even a  
single closed  
hyperbolic 3-manifold?**

# Step 1: Ask for less

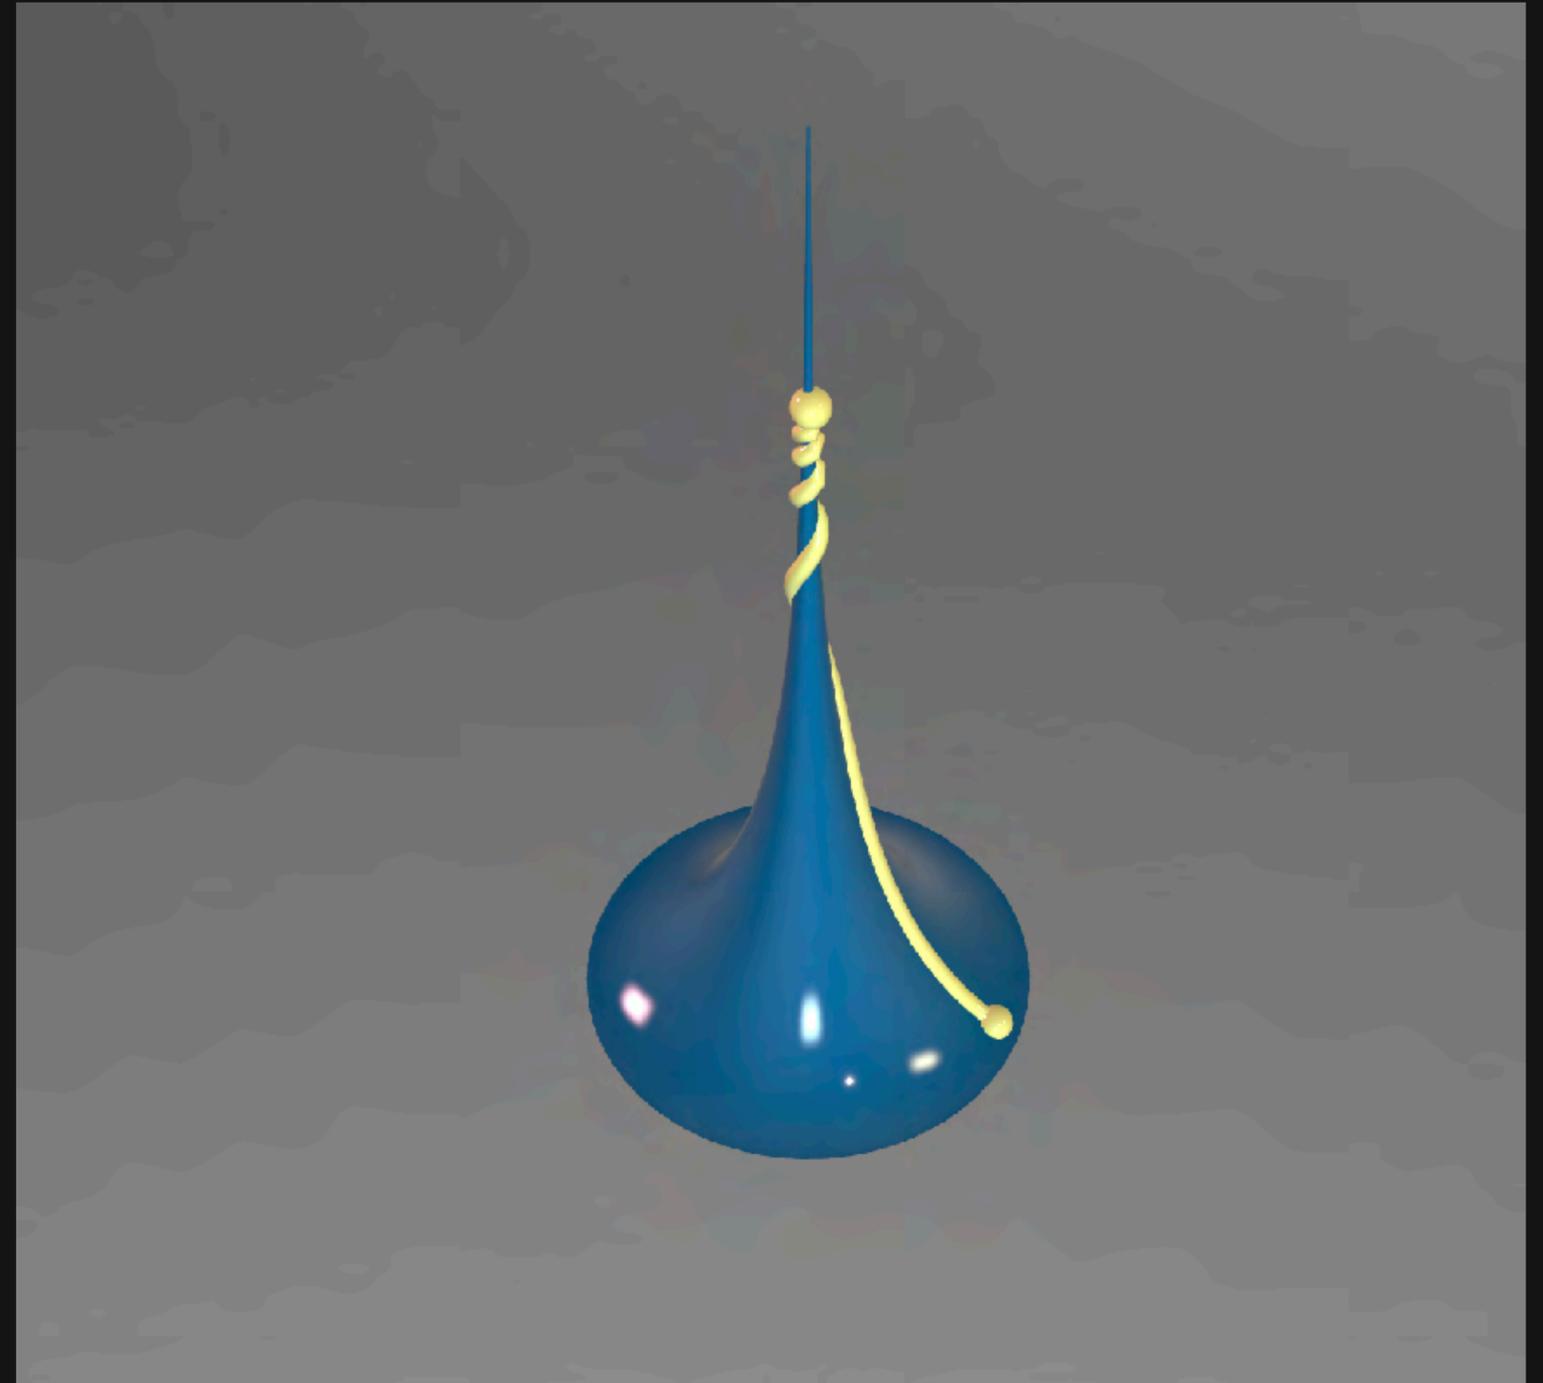

If we allow the freedom to work with open manifolds as well, can we succeed?

# Geometrization of the punctured disk:

[\(Open Animation\)](#)

**Putting a complete metric on a punctured torus.**

**Complete**  
**Infinite Area**

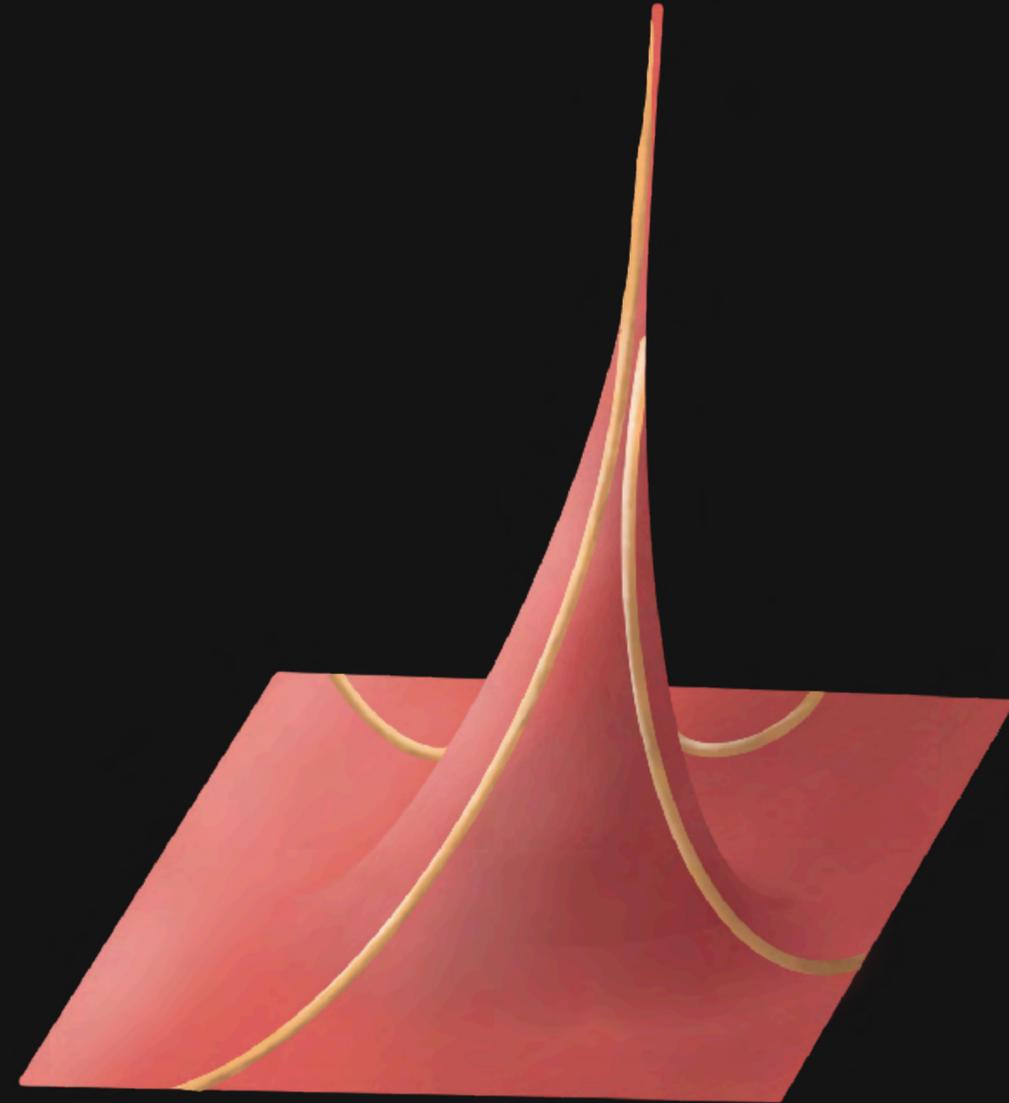

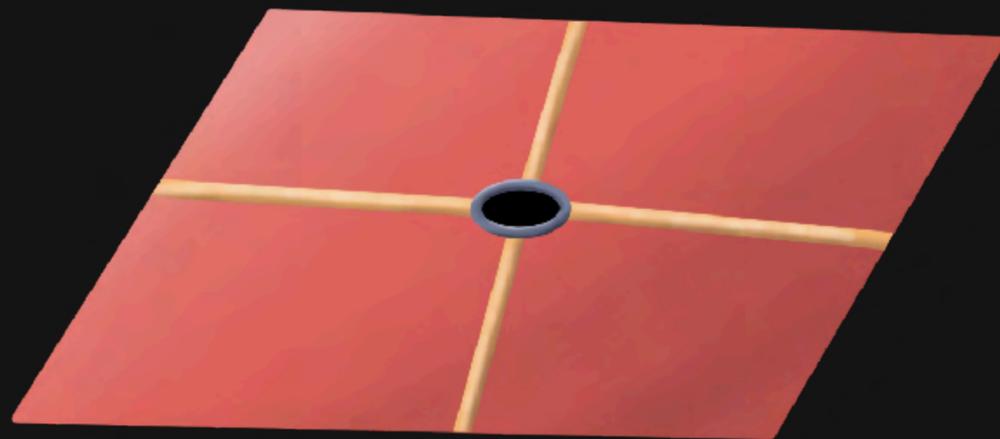

**Incomplete**

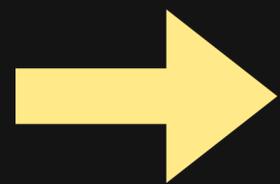

**Complete**  
**Finite Area**

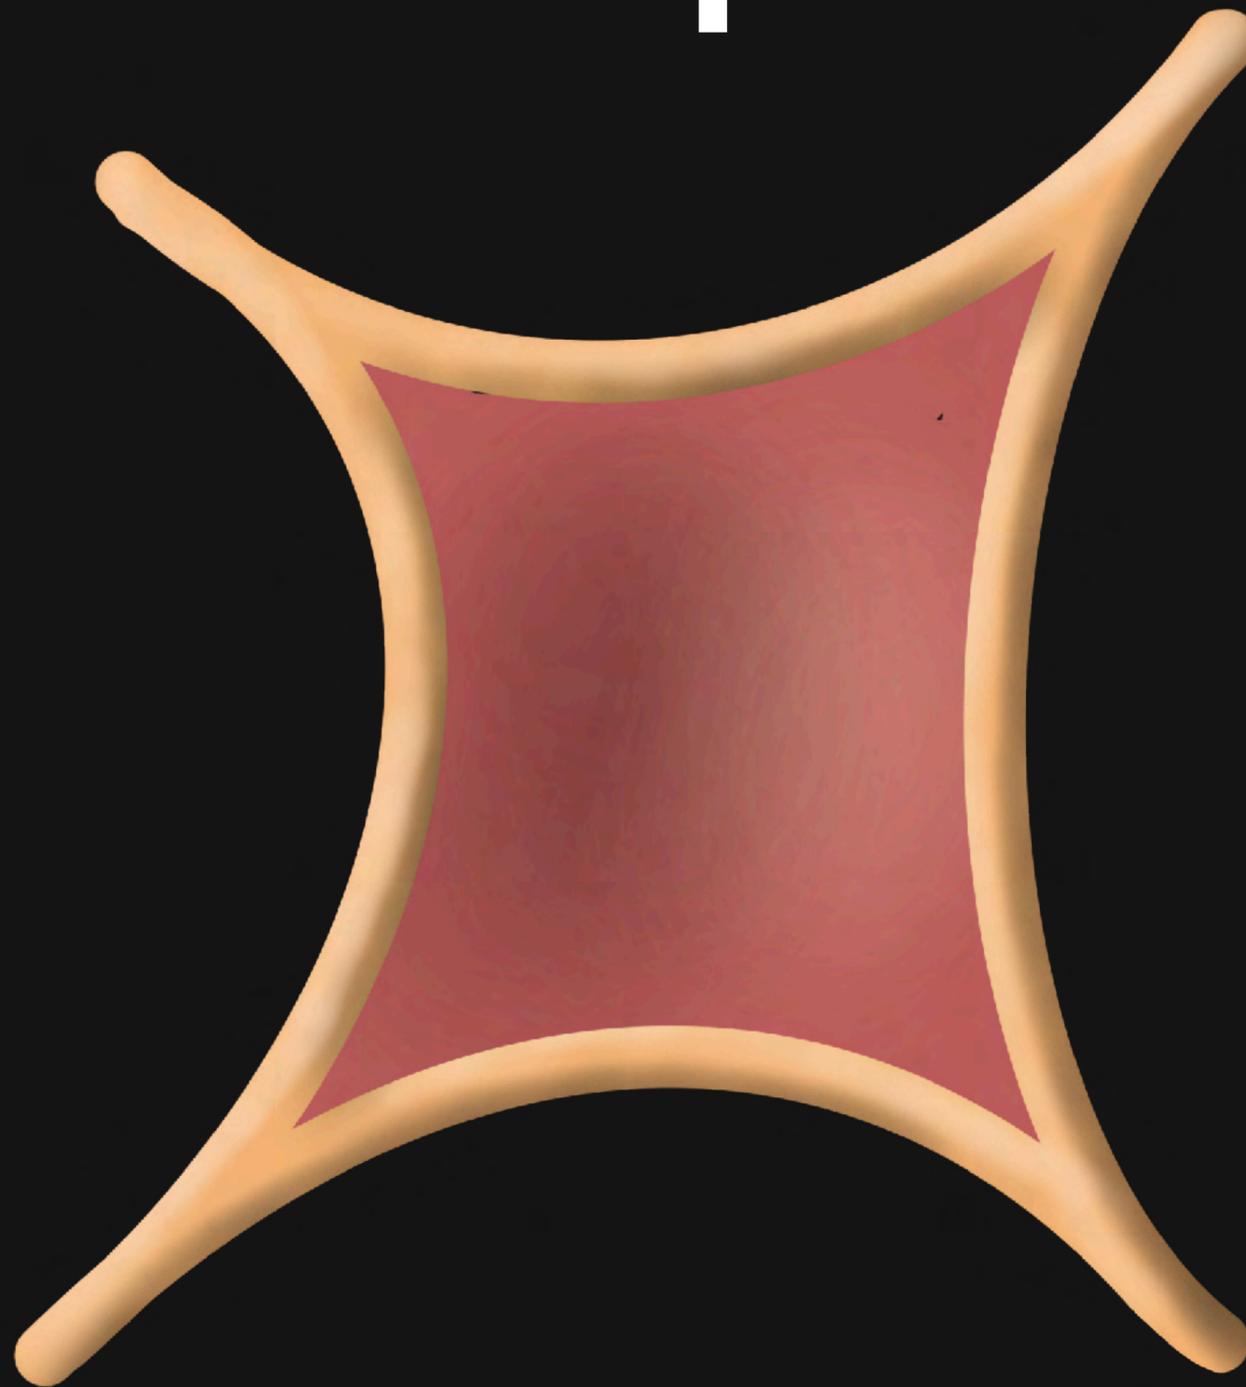

**What happens to the metric near the puncture?**

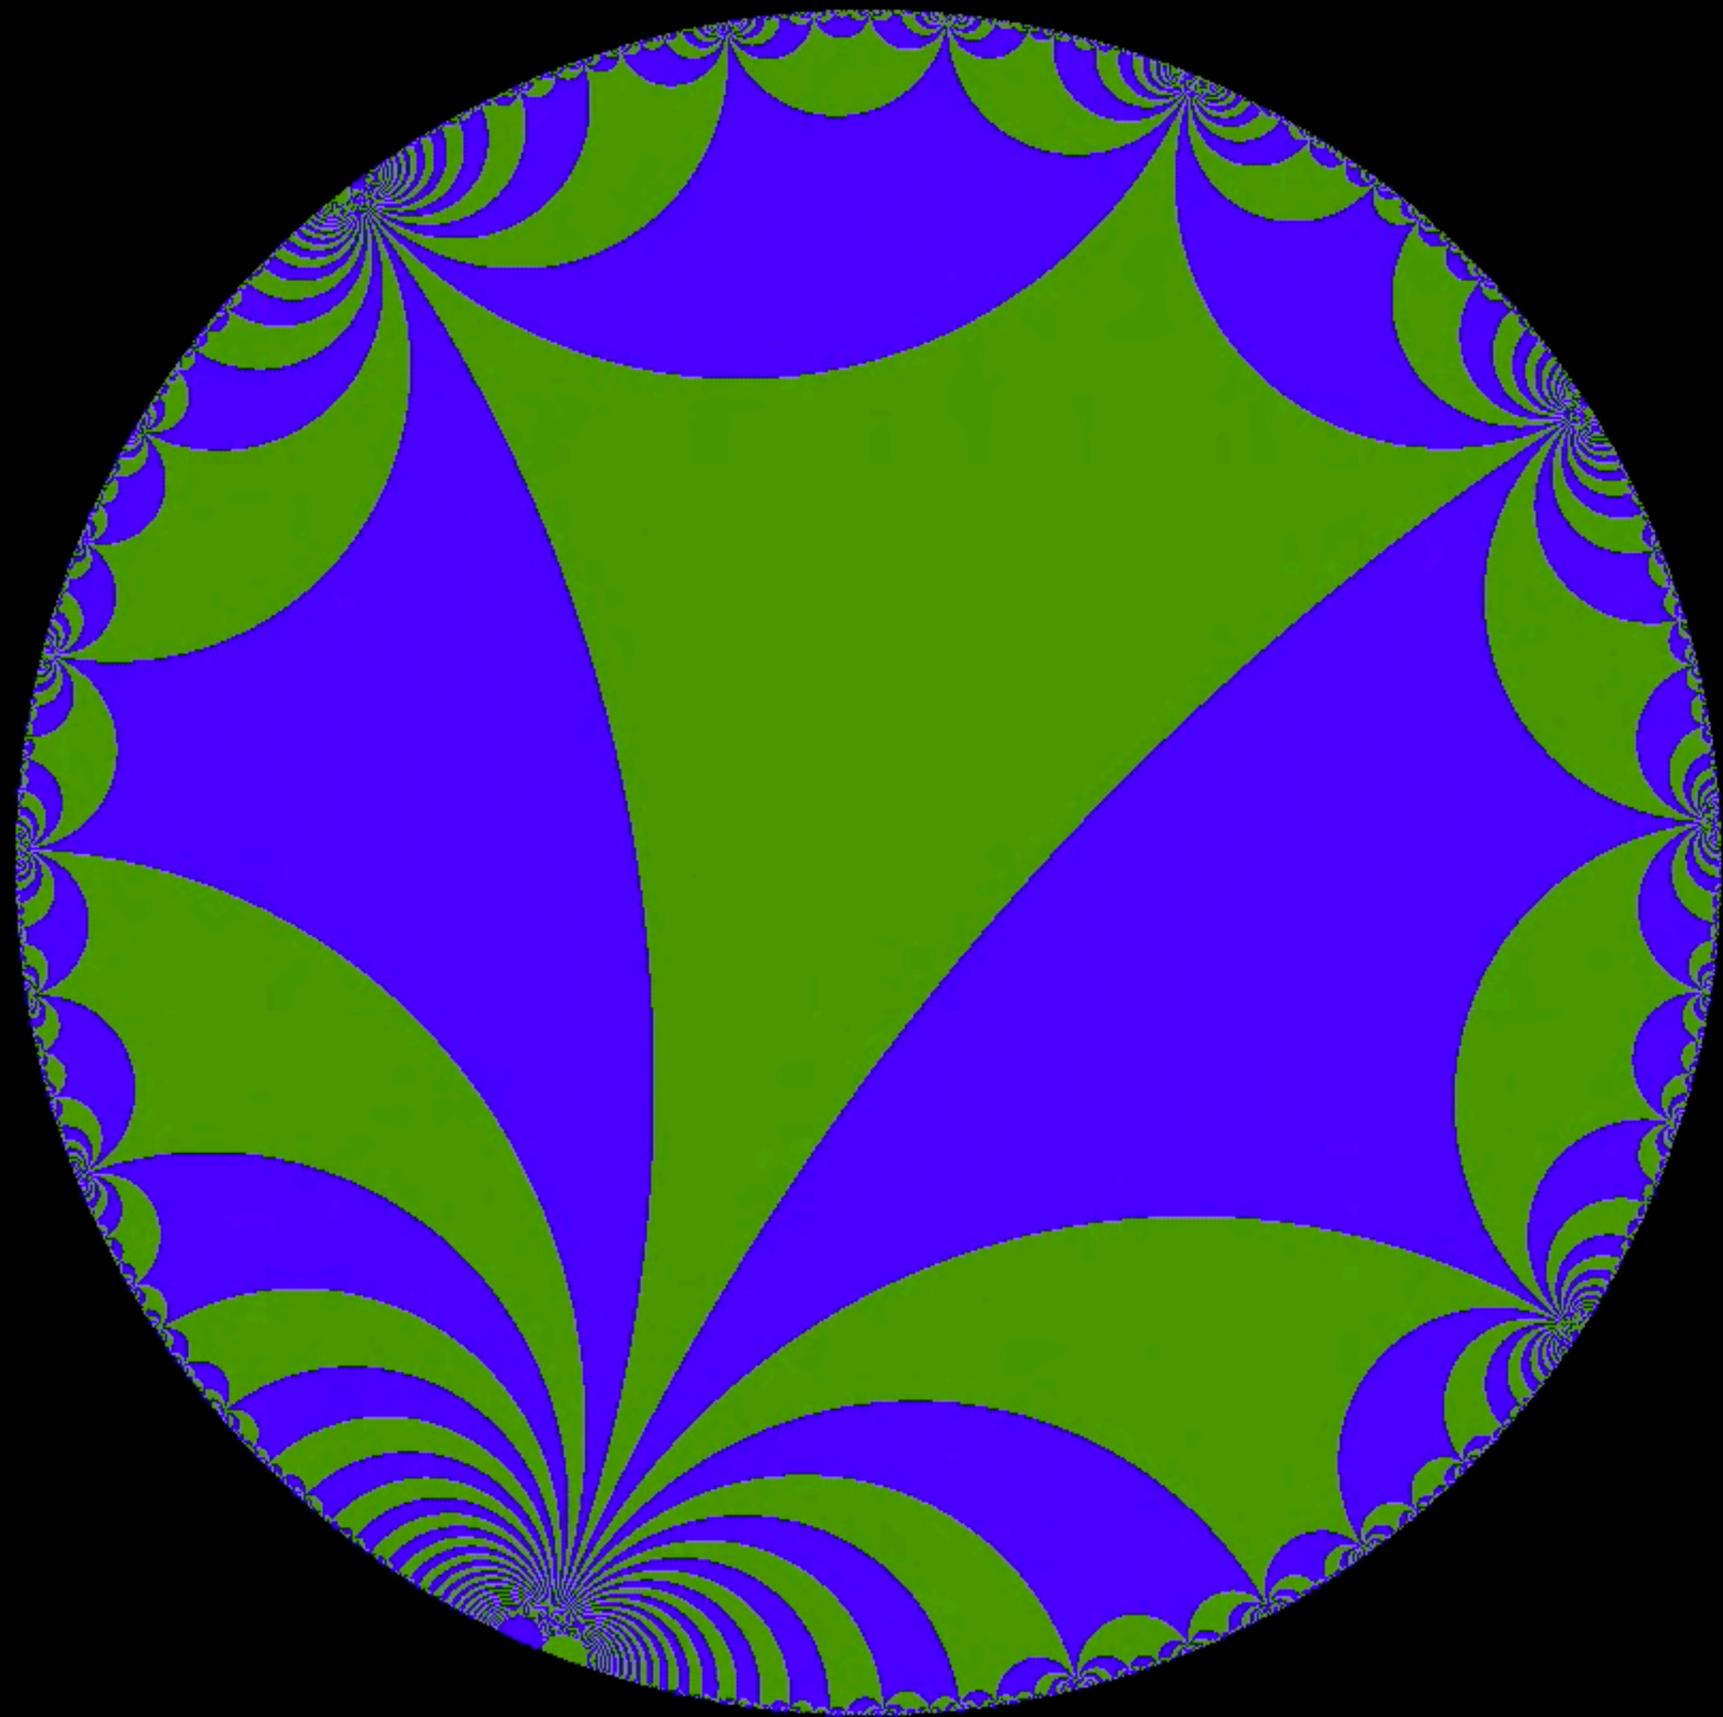

**Squares**

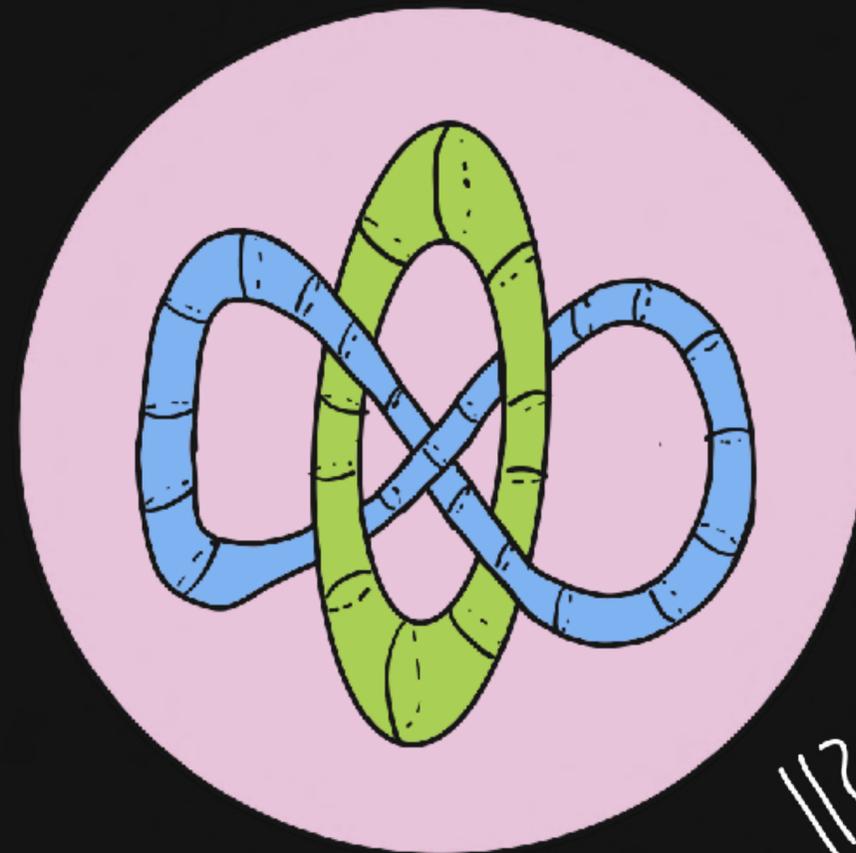

**Ideal Squares**

**Is it easier to think of  
interesting 3D open  
manifolds?**

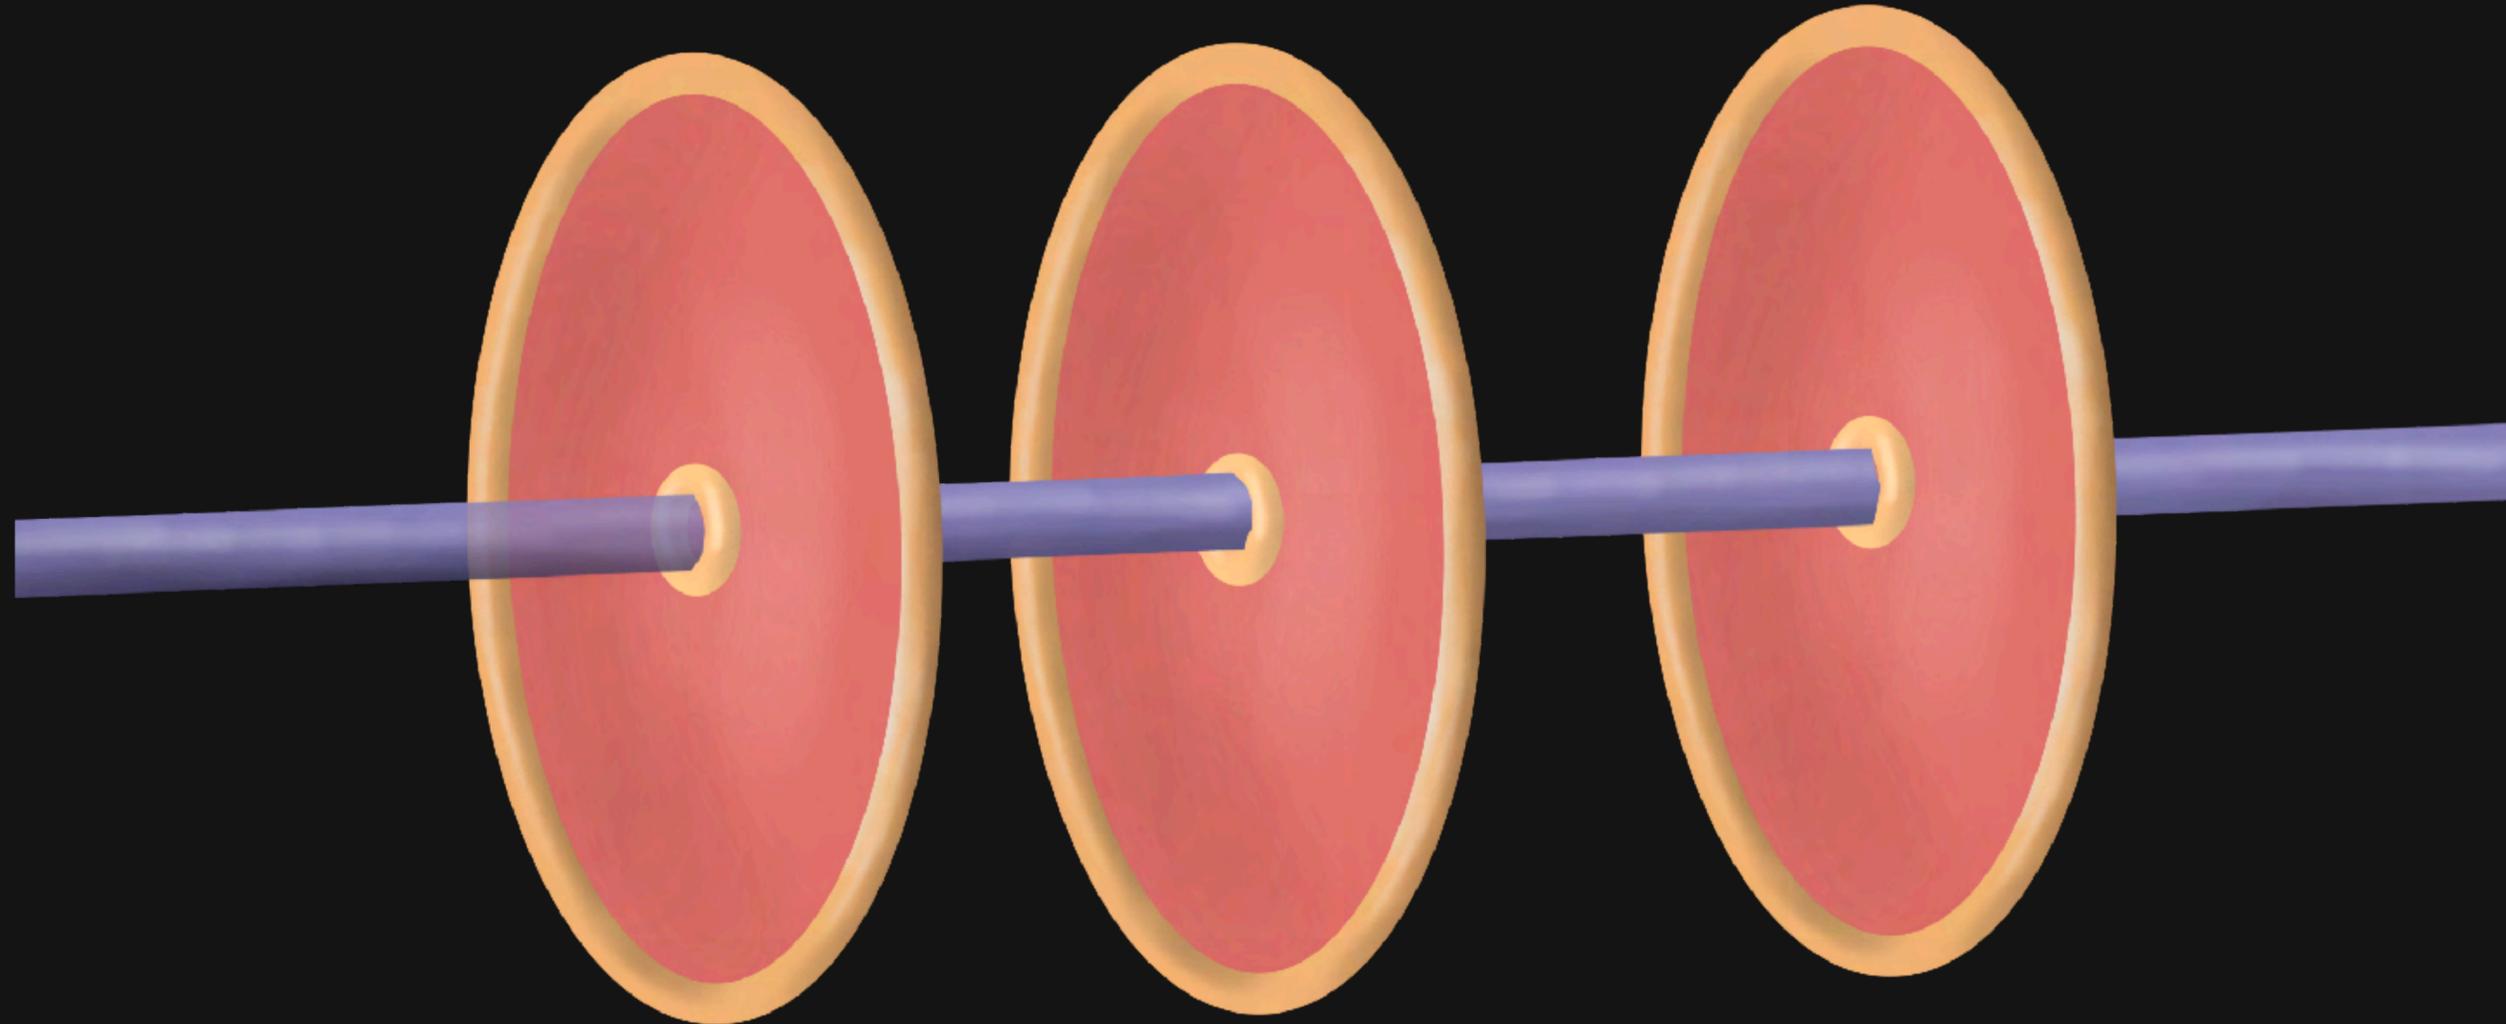

**YES**

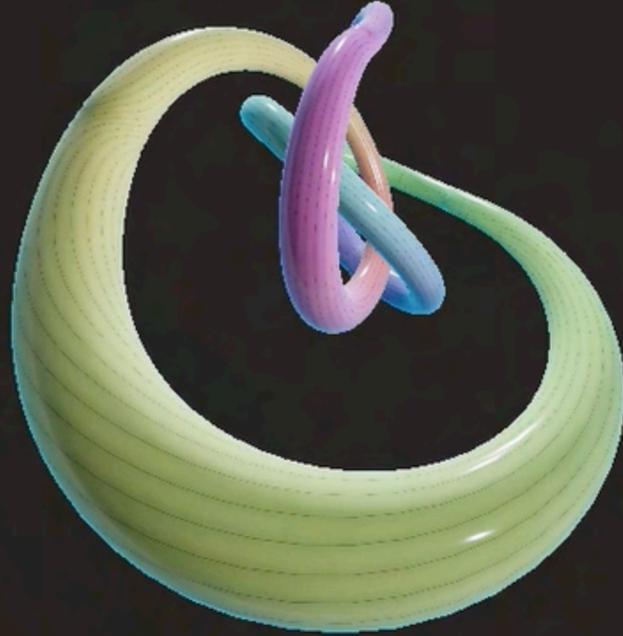

**Knot and Link  
Complements!**

**Make the disks orthogonal to the knot....hyperbolic!**

# Figure 8 Knot

# Building the Hyperbolic Structure

A TOPOLOGICAL PICTUREBOOK

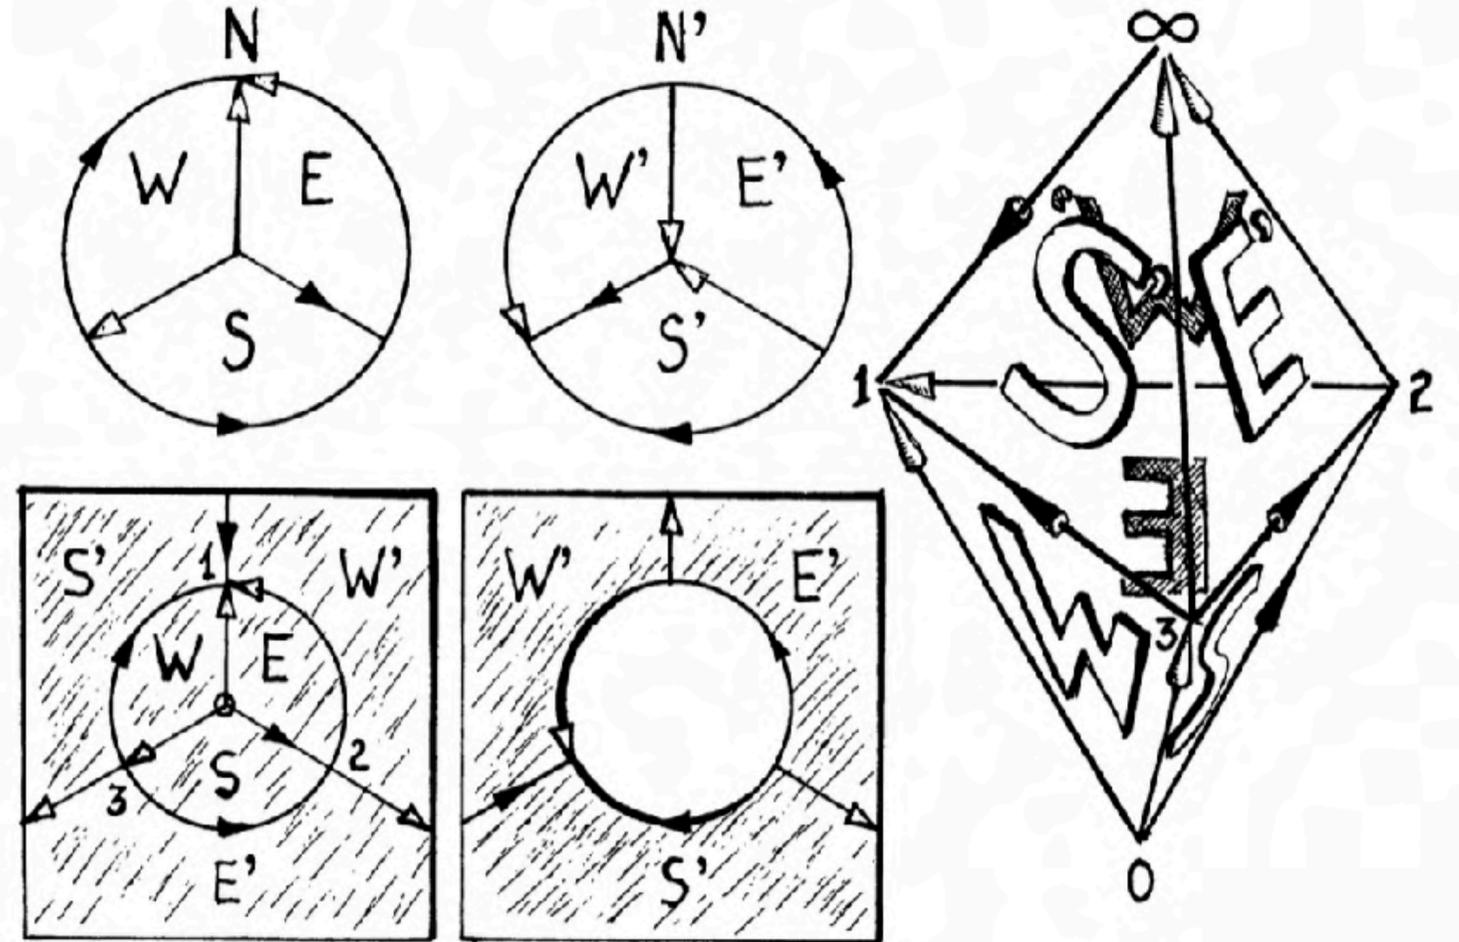

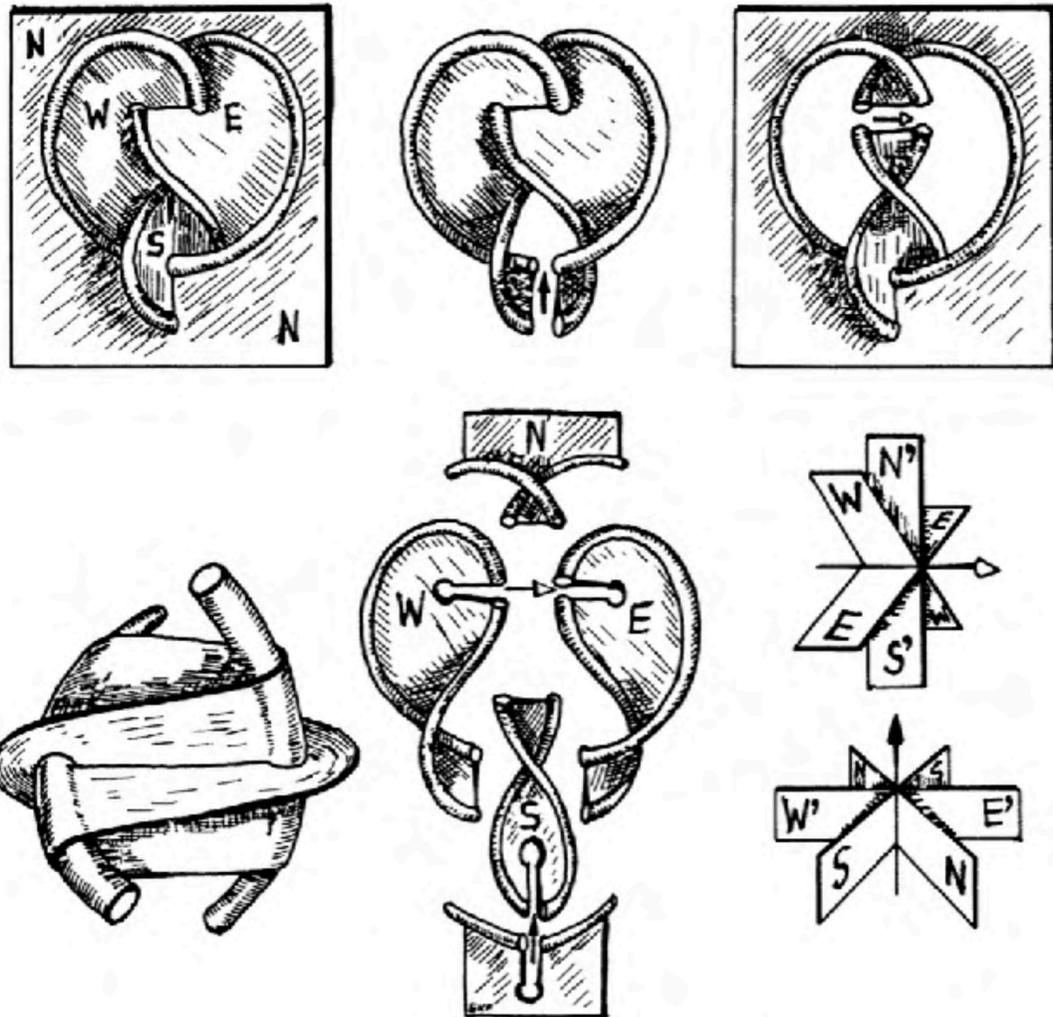

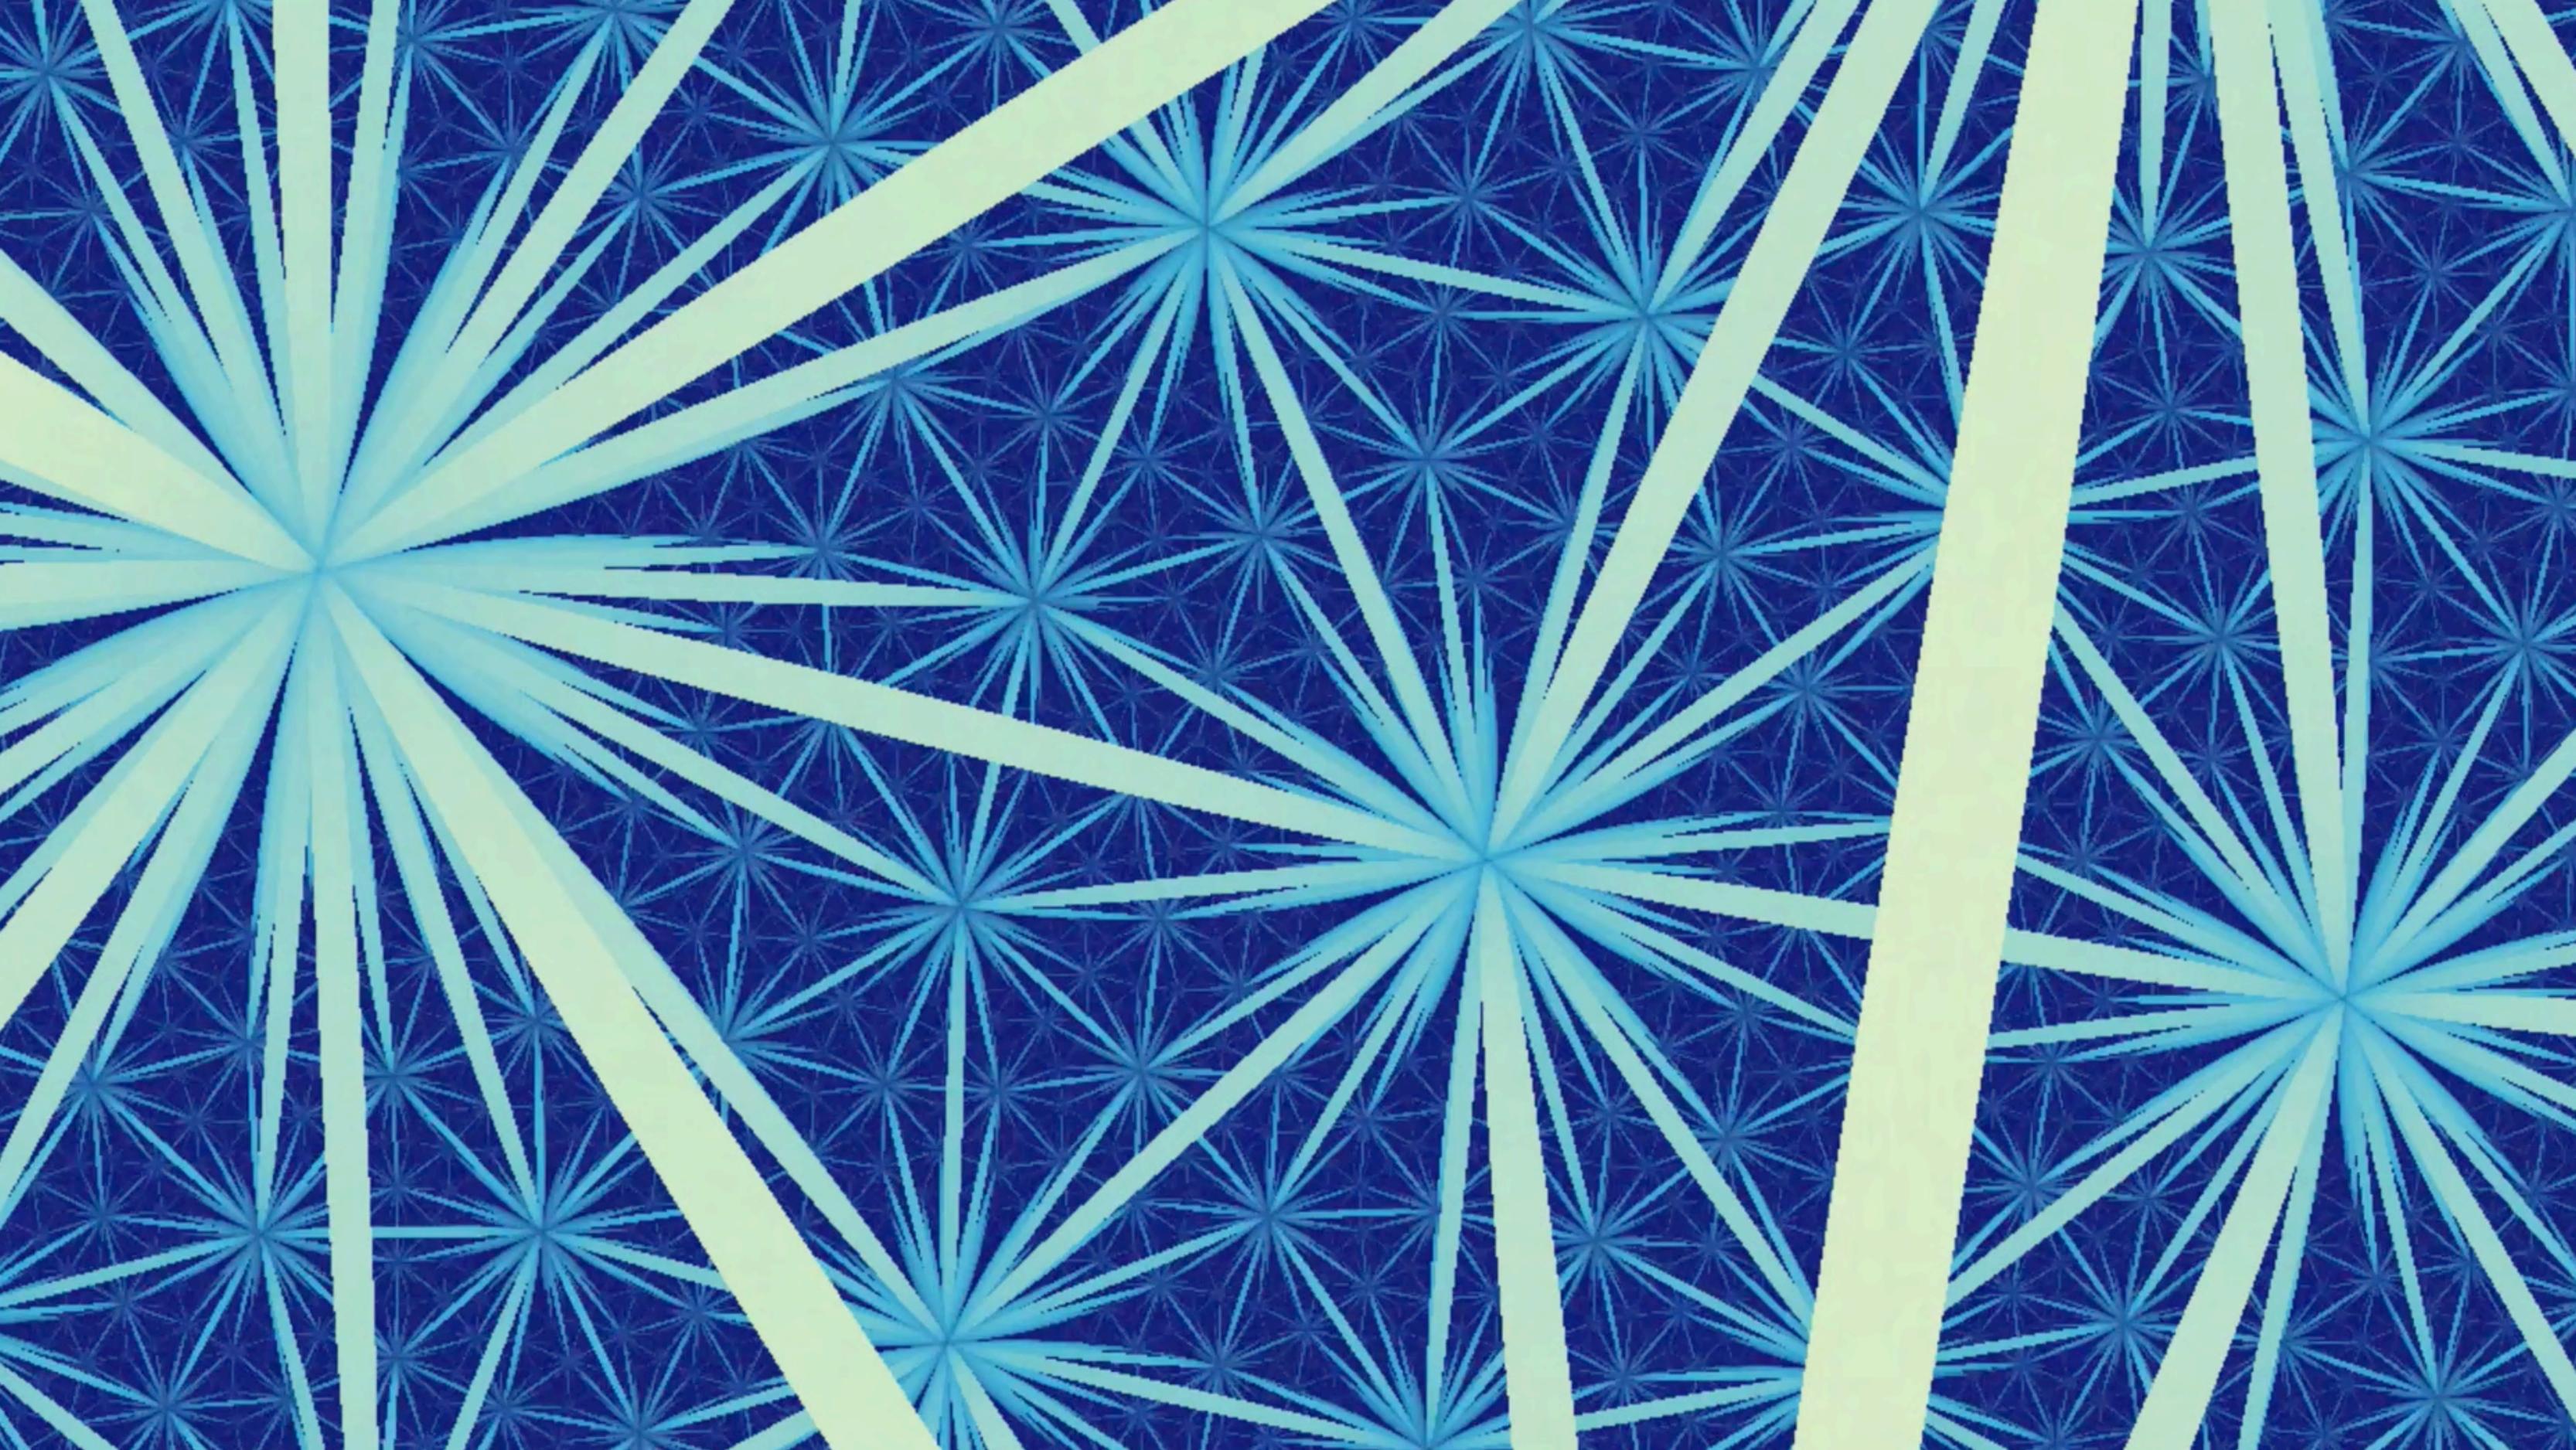

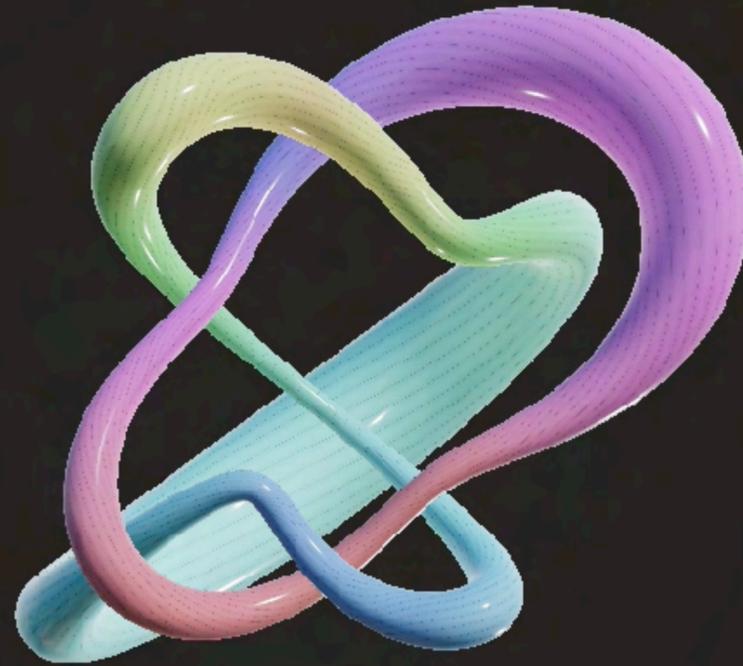

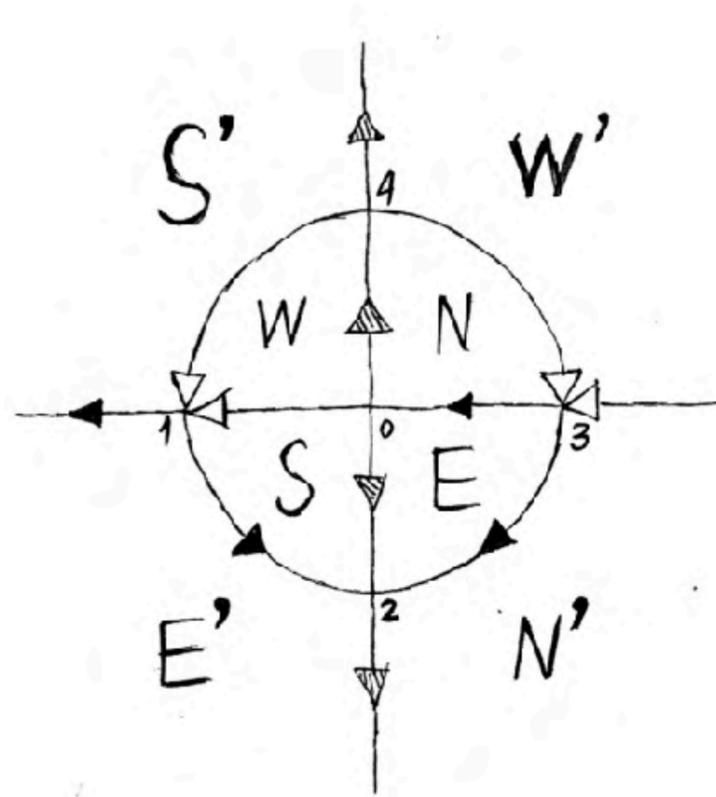

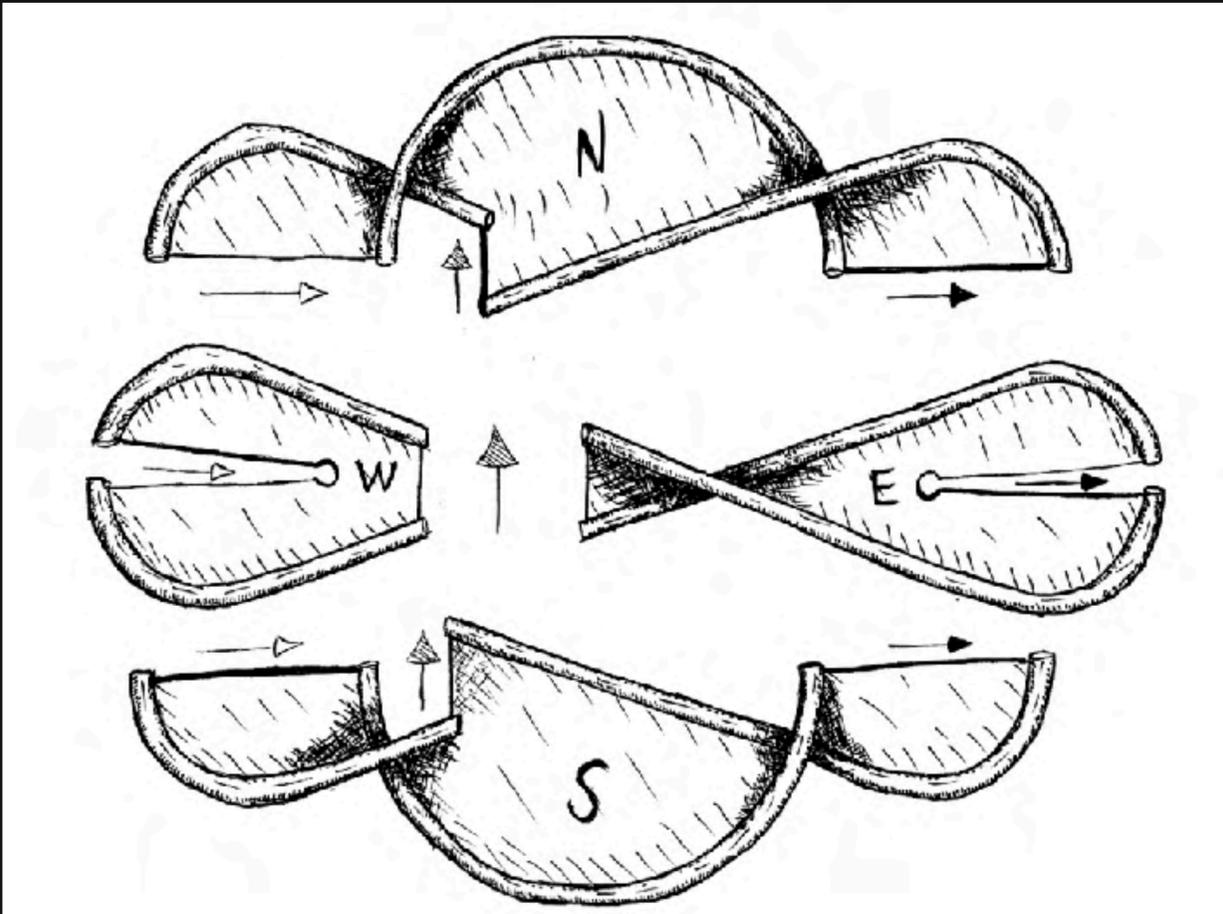

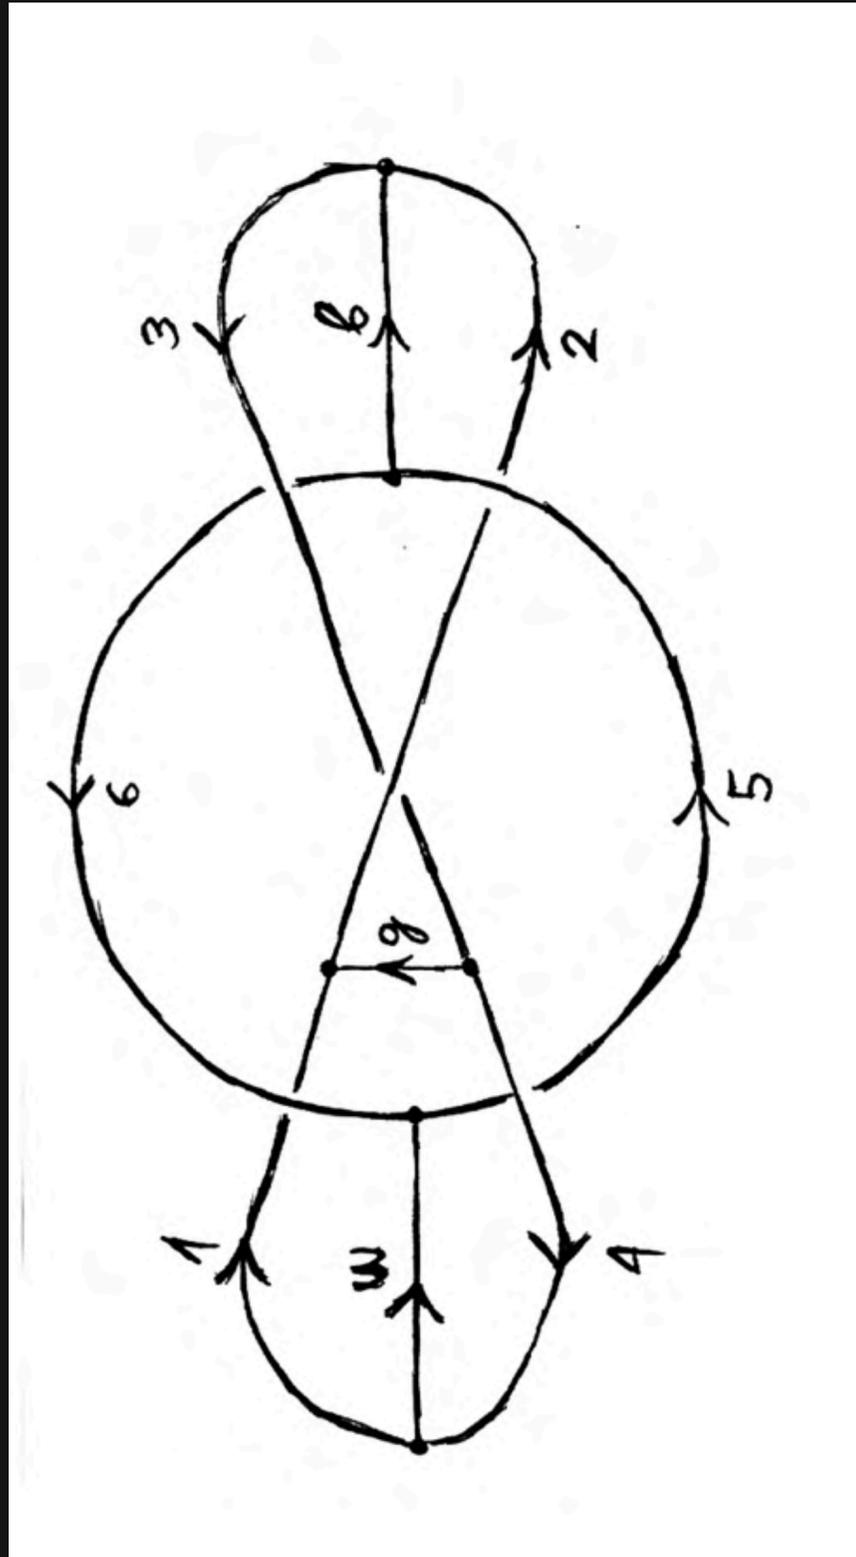

Figure 2

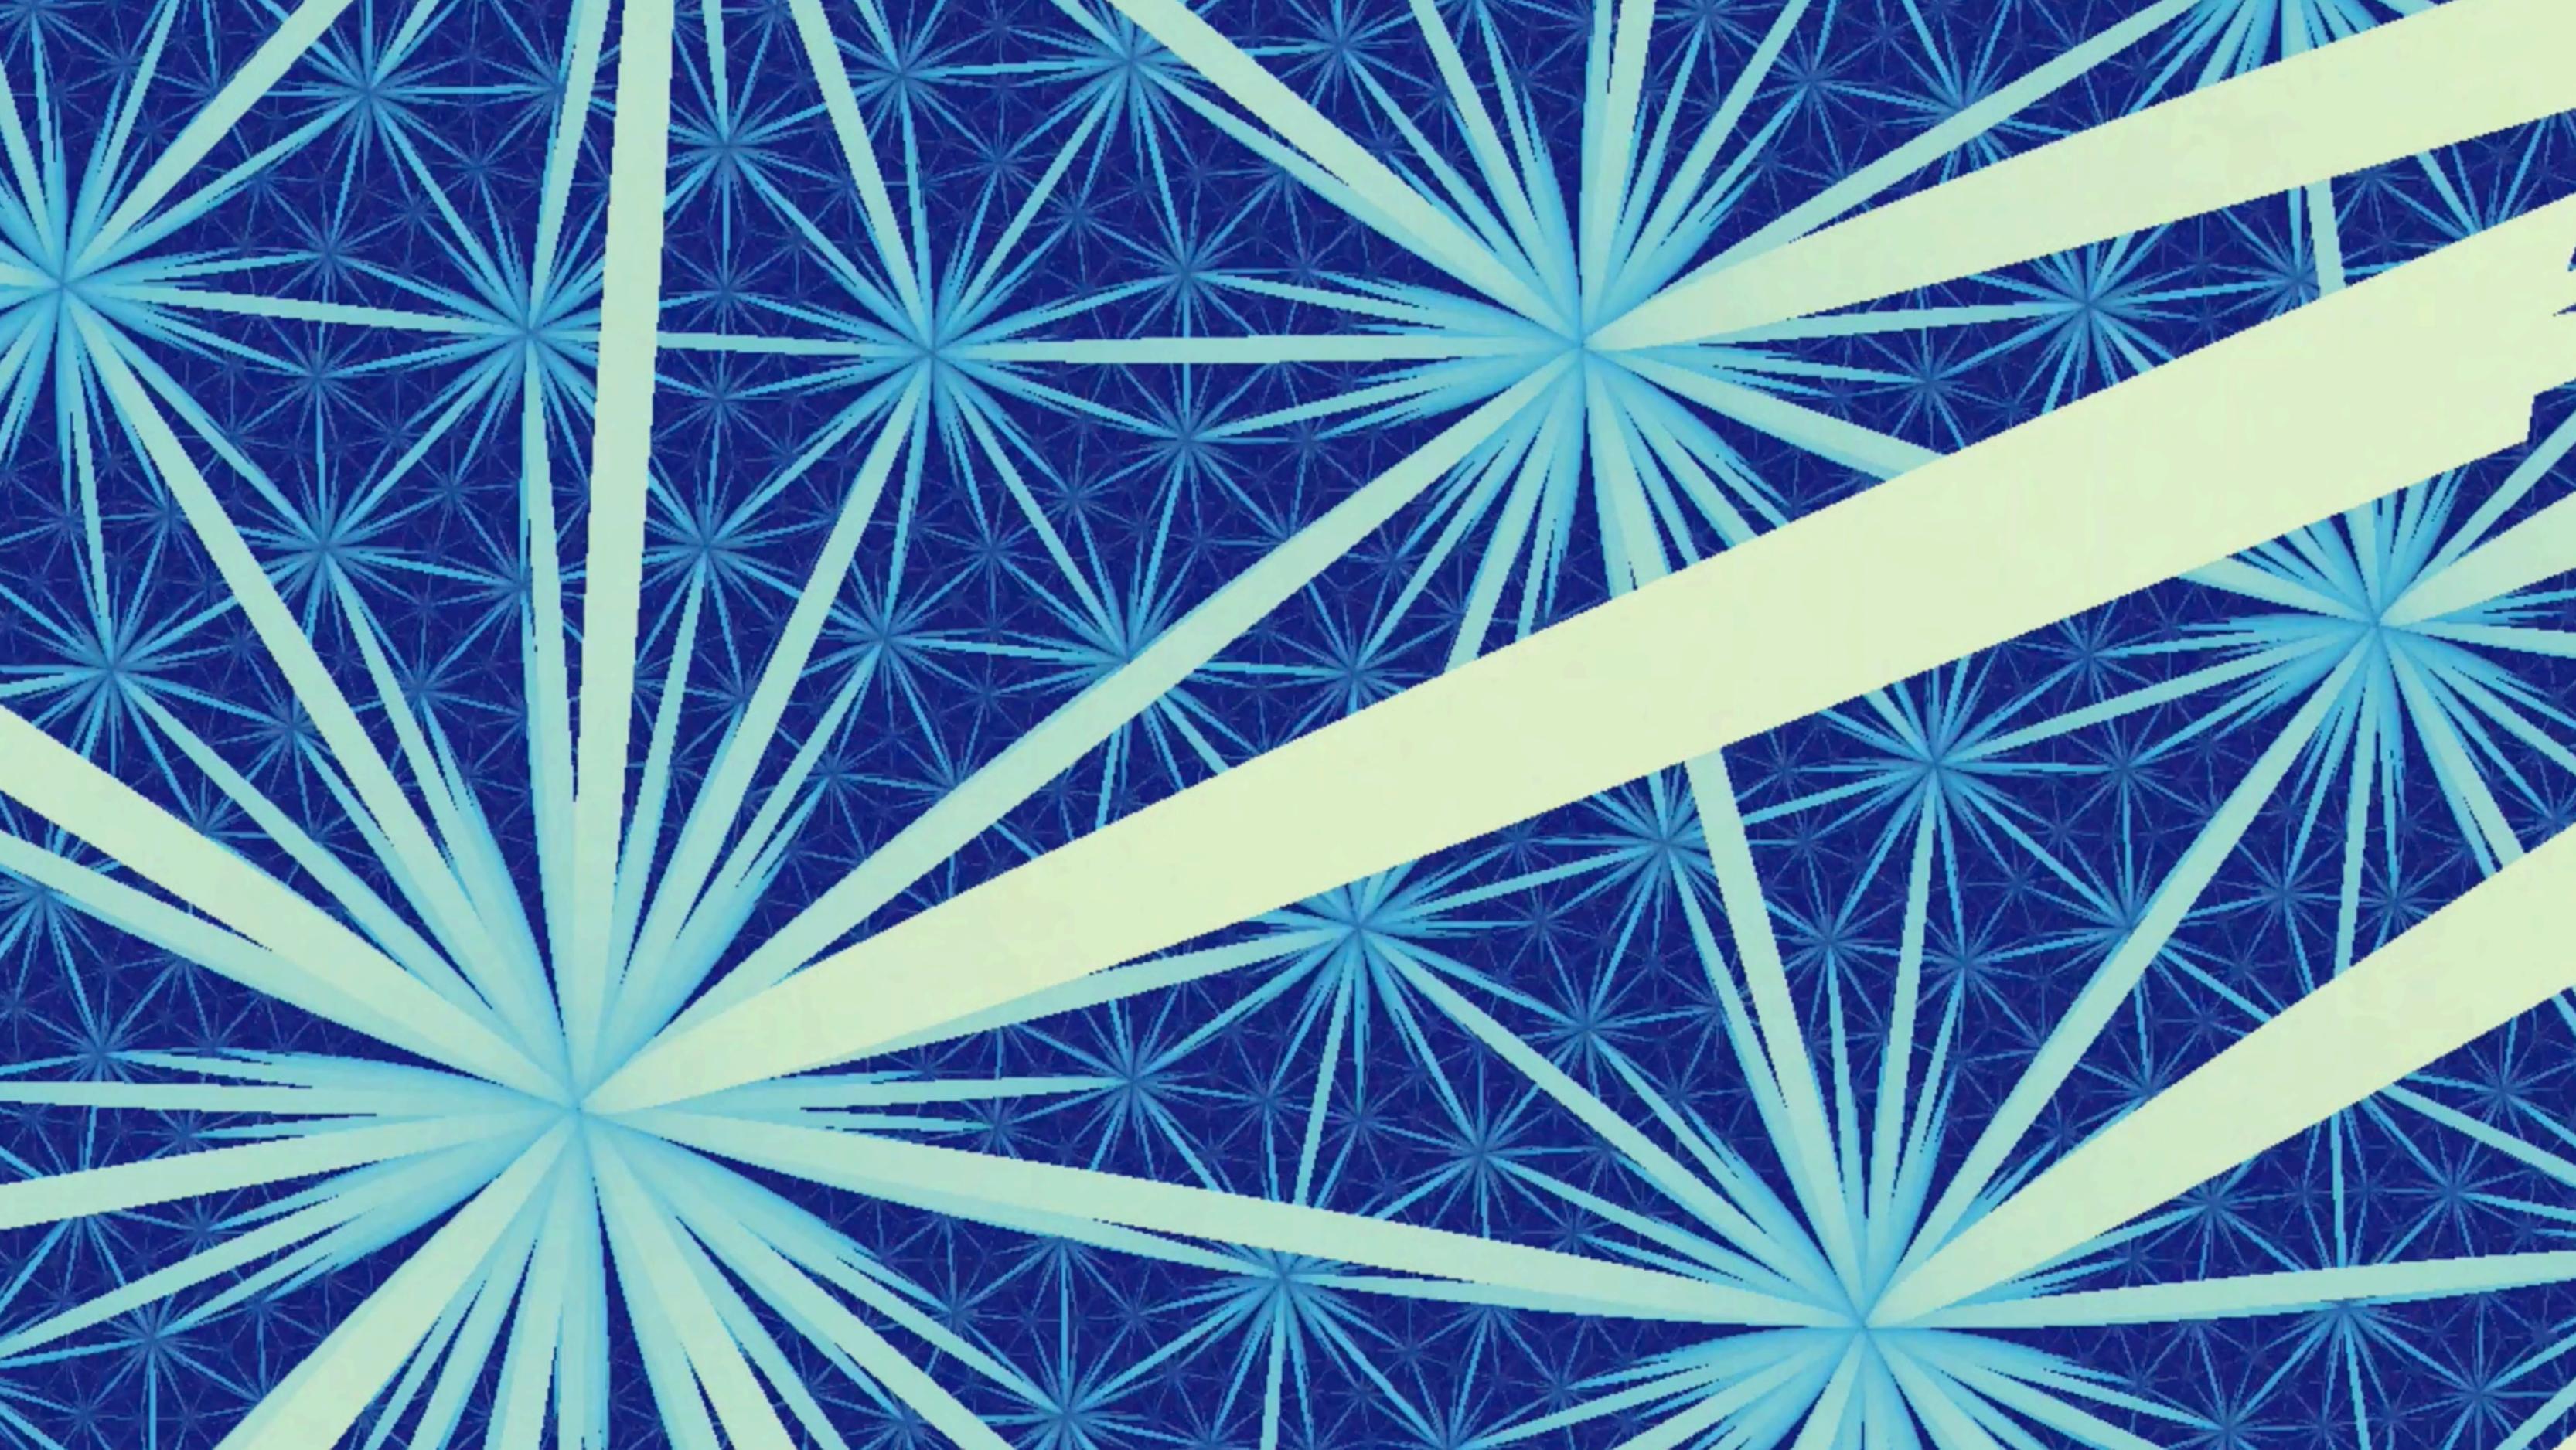

HEXAHEDRAL COMPLEMENT

# The Whitehead Link

**When does this  
Actually work?**

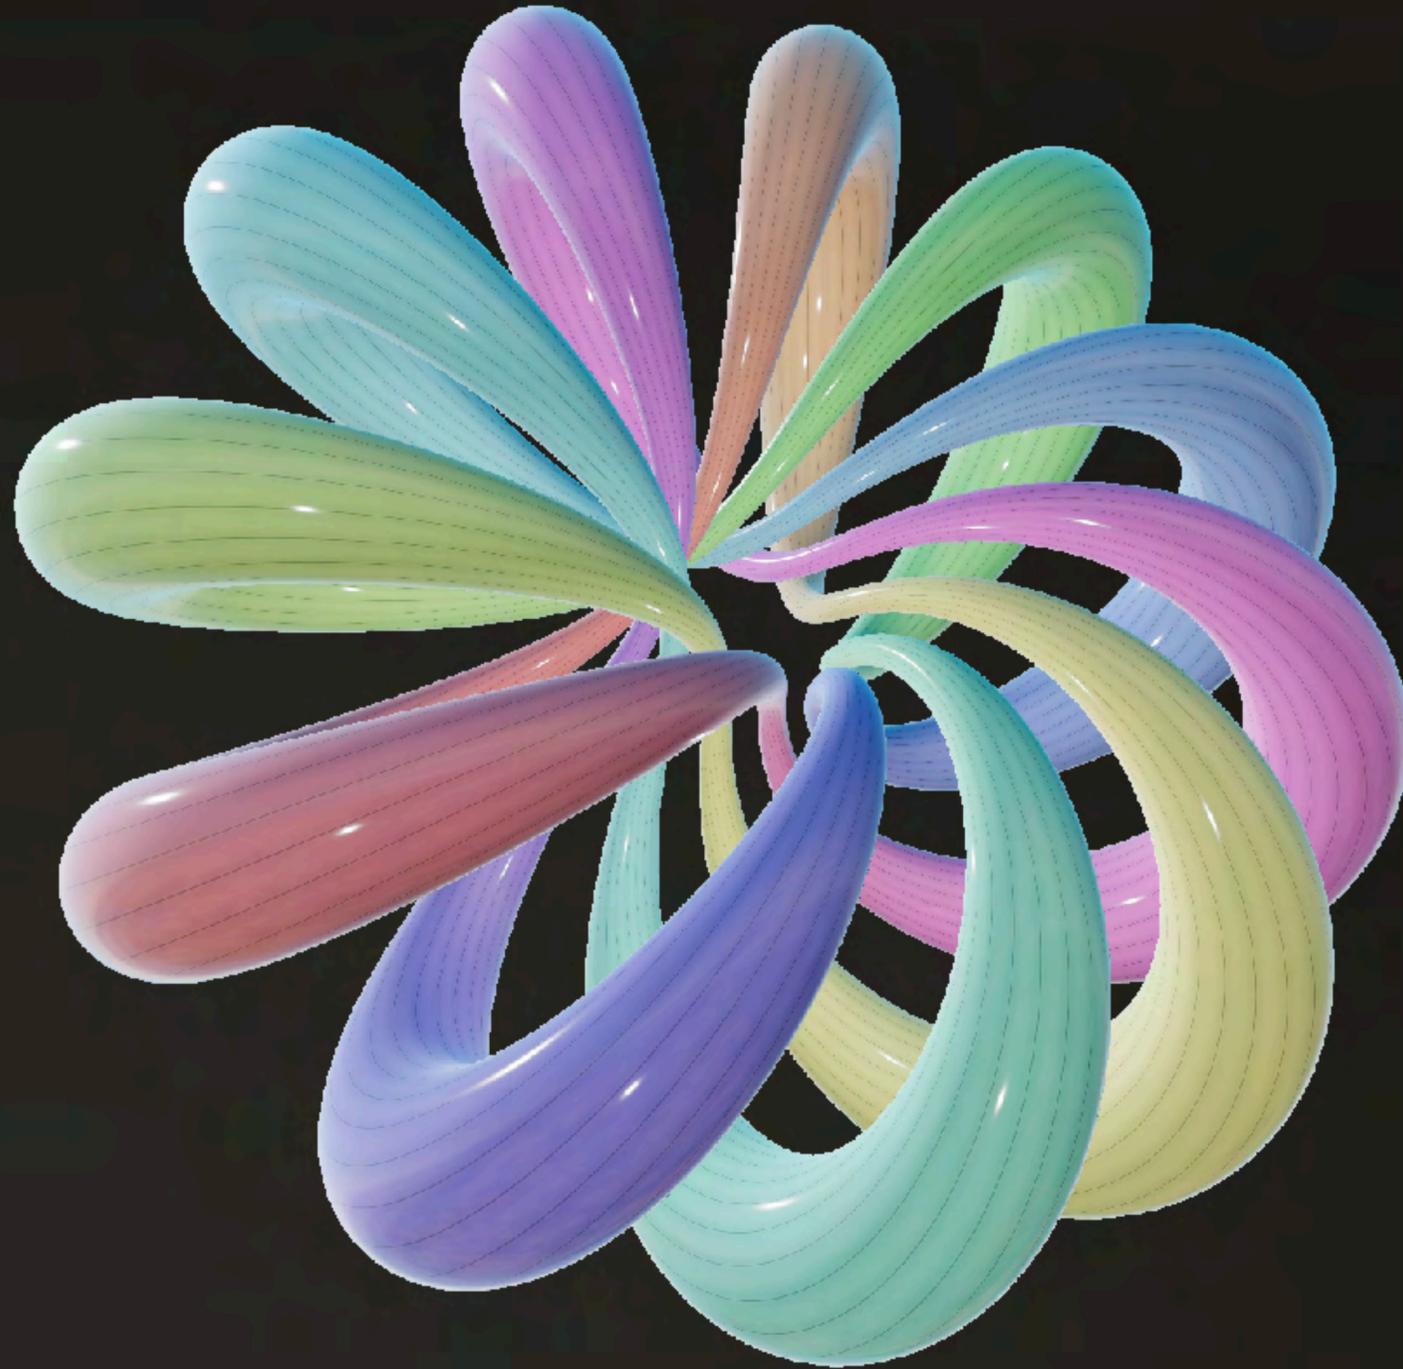

**How many knot complements  
admit hyperbolic metrics?**

# THURSTON

**Every knot, with the exception of torus and satellite knots, is hyperbolic.**

# Torus Knots

Lie on the  
surface of a  
torus

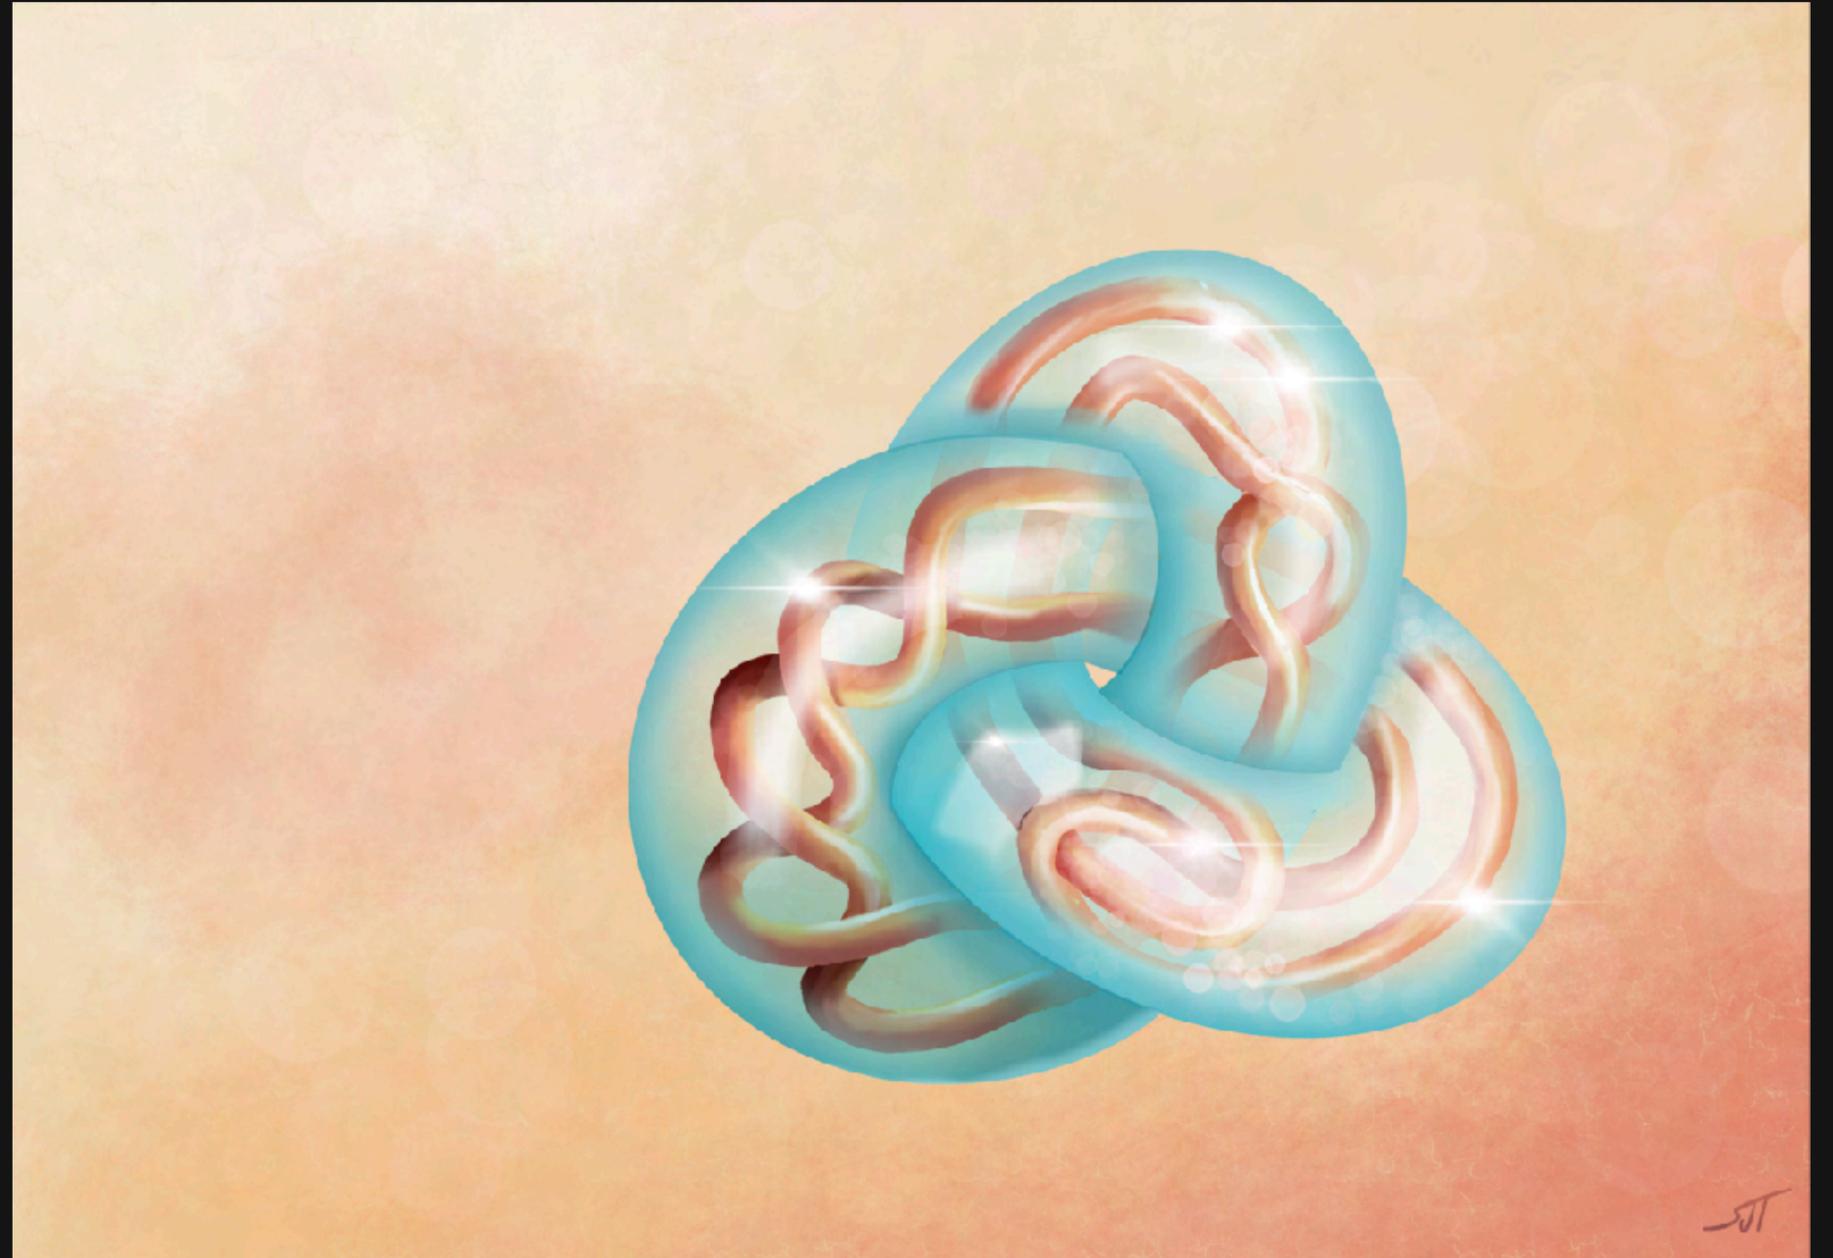

# Satellite Knots

**“Knots within  
knots”**

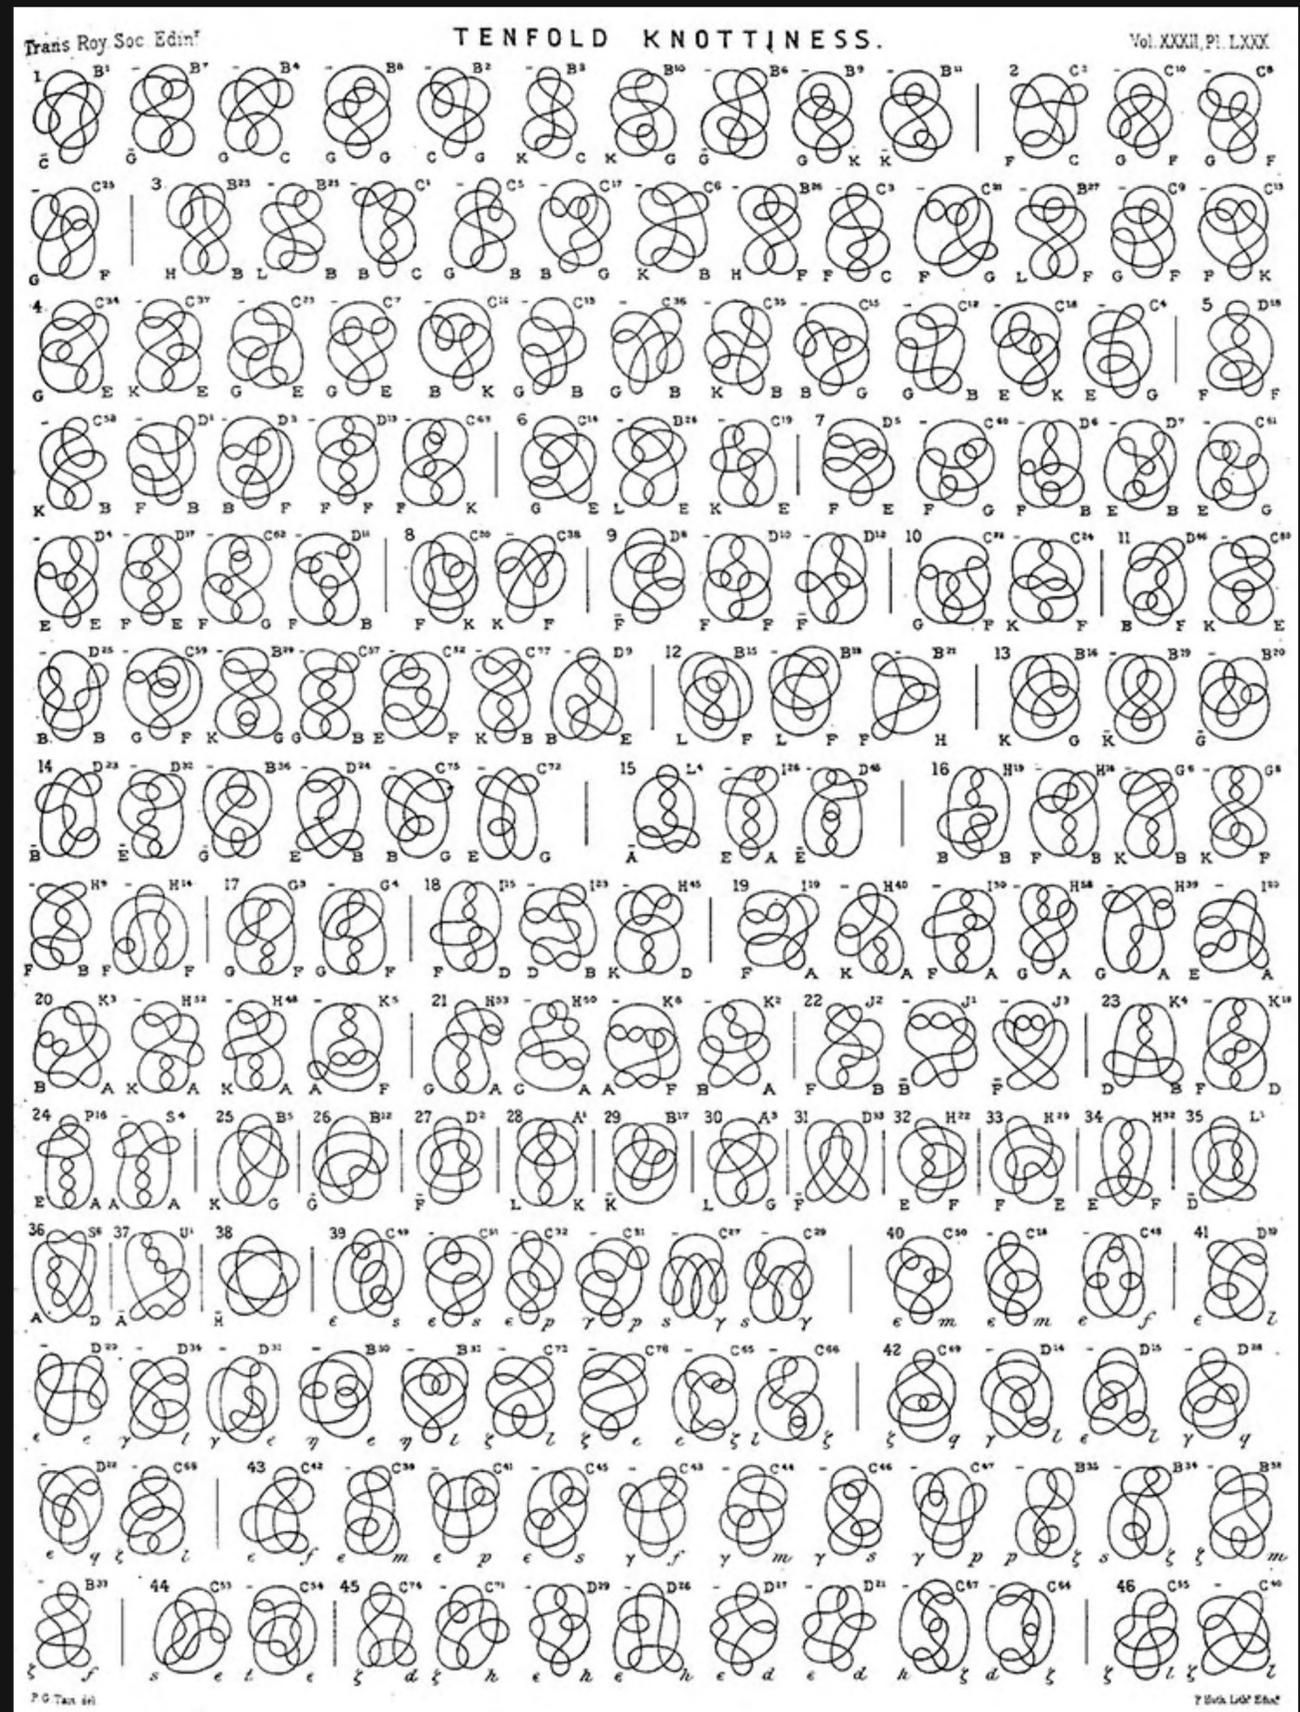

# Satellite Knots

“Knots within  
knots”

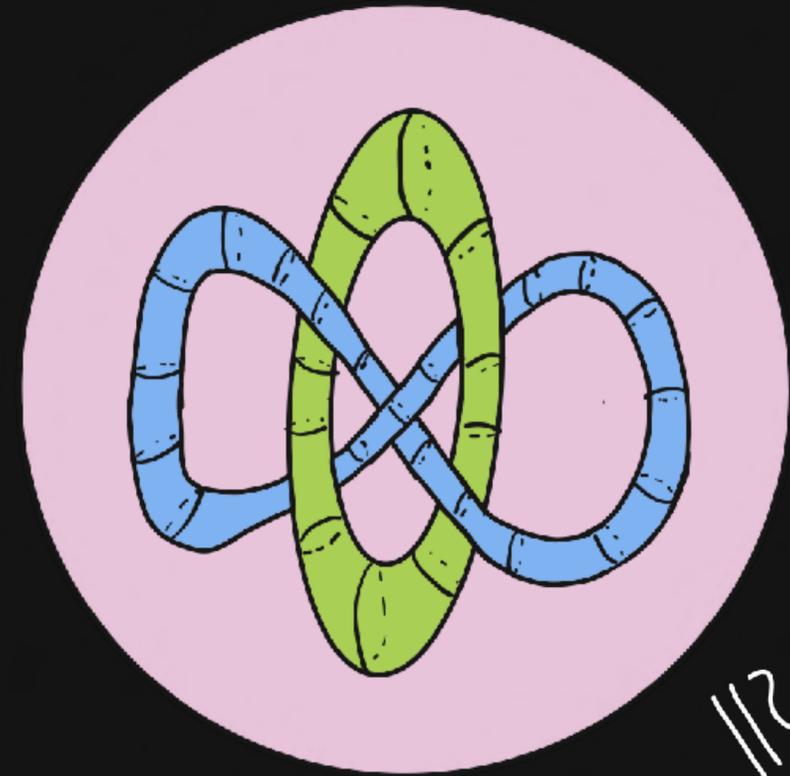

Most knots are hyperbolic!

How Does this Help?

We need a **CLOSED**

**MANIFOLD!**

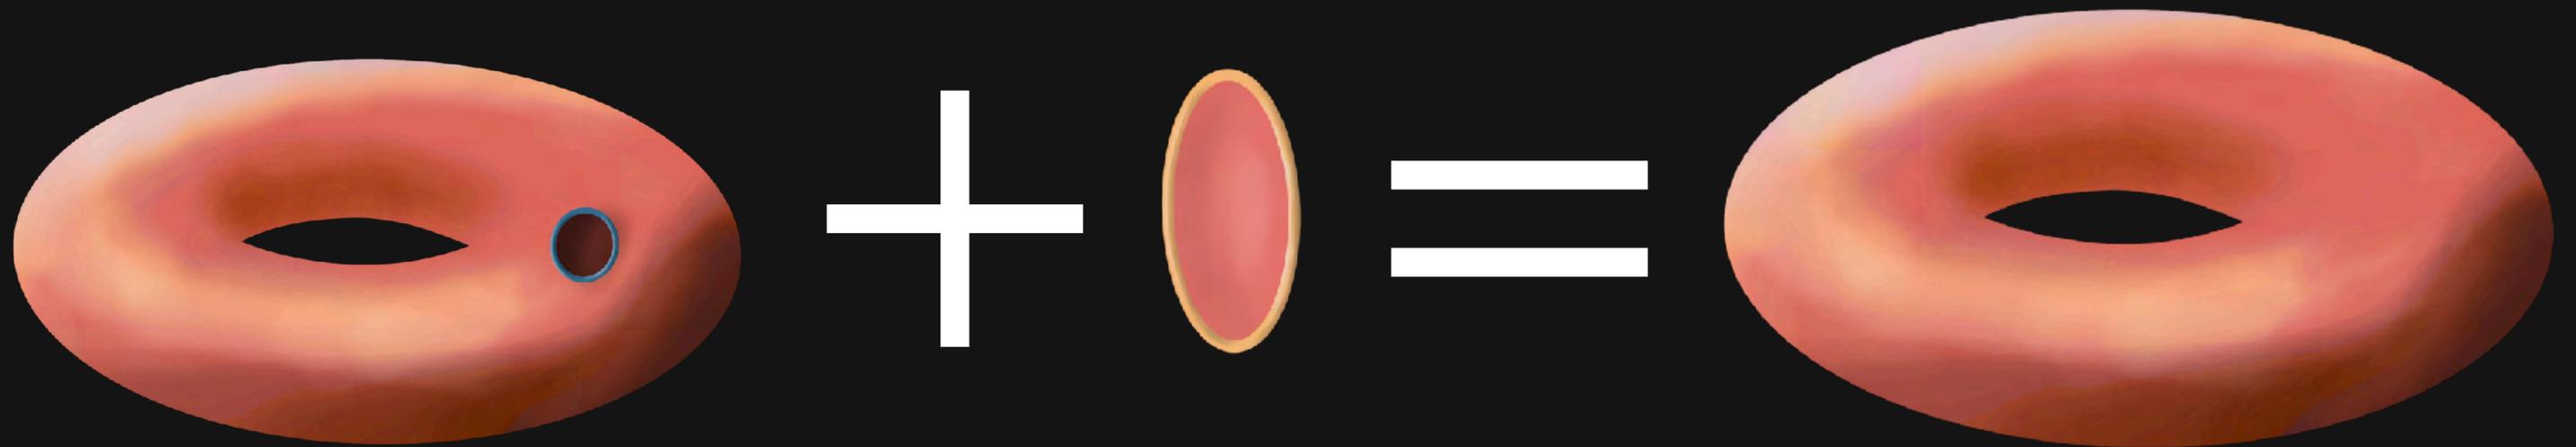

**Idea!**

**“Plug” the  
(torus shaped)  
“hole”**

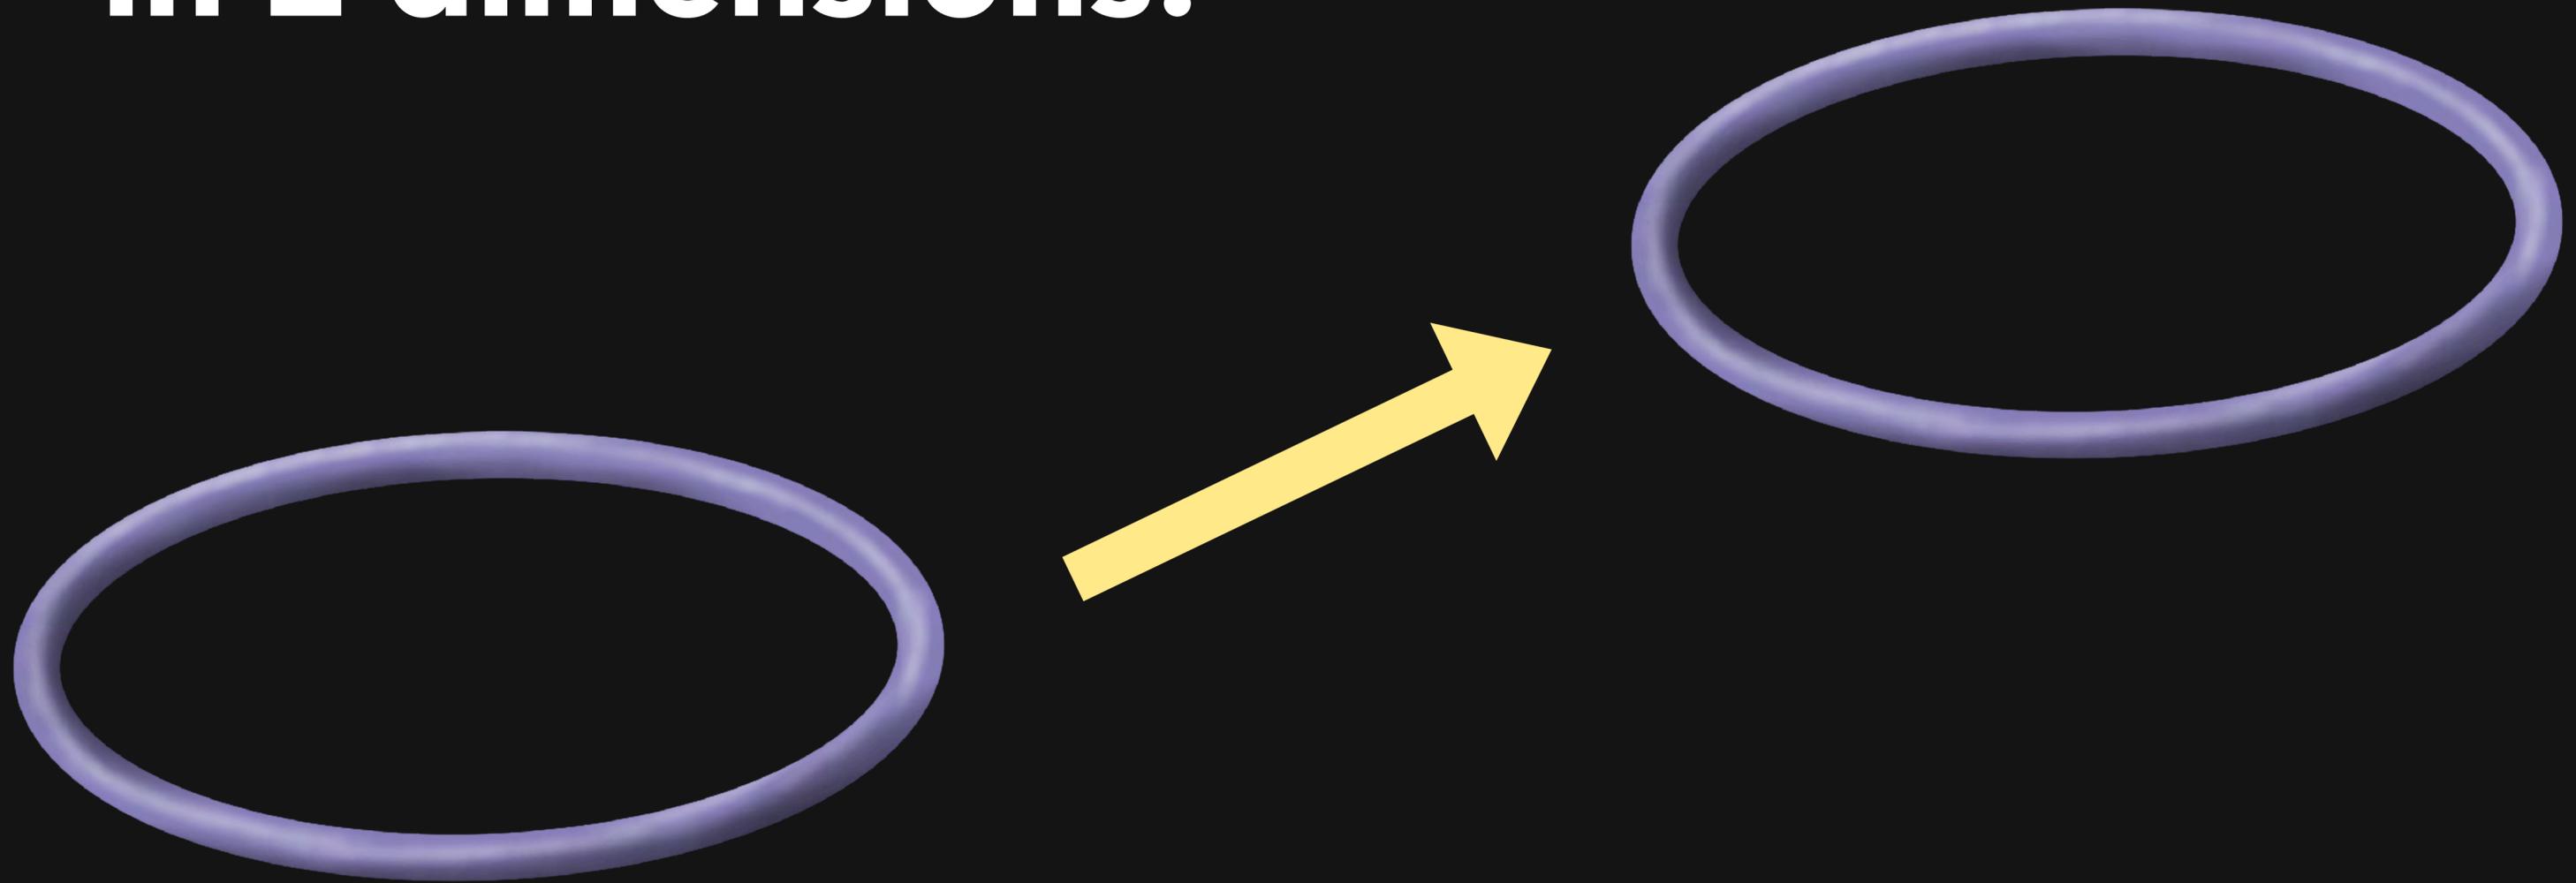

**This is called Dehn Filling**

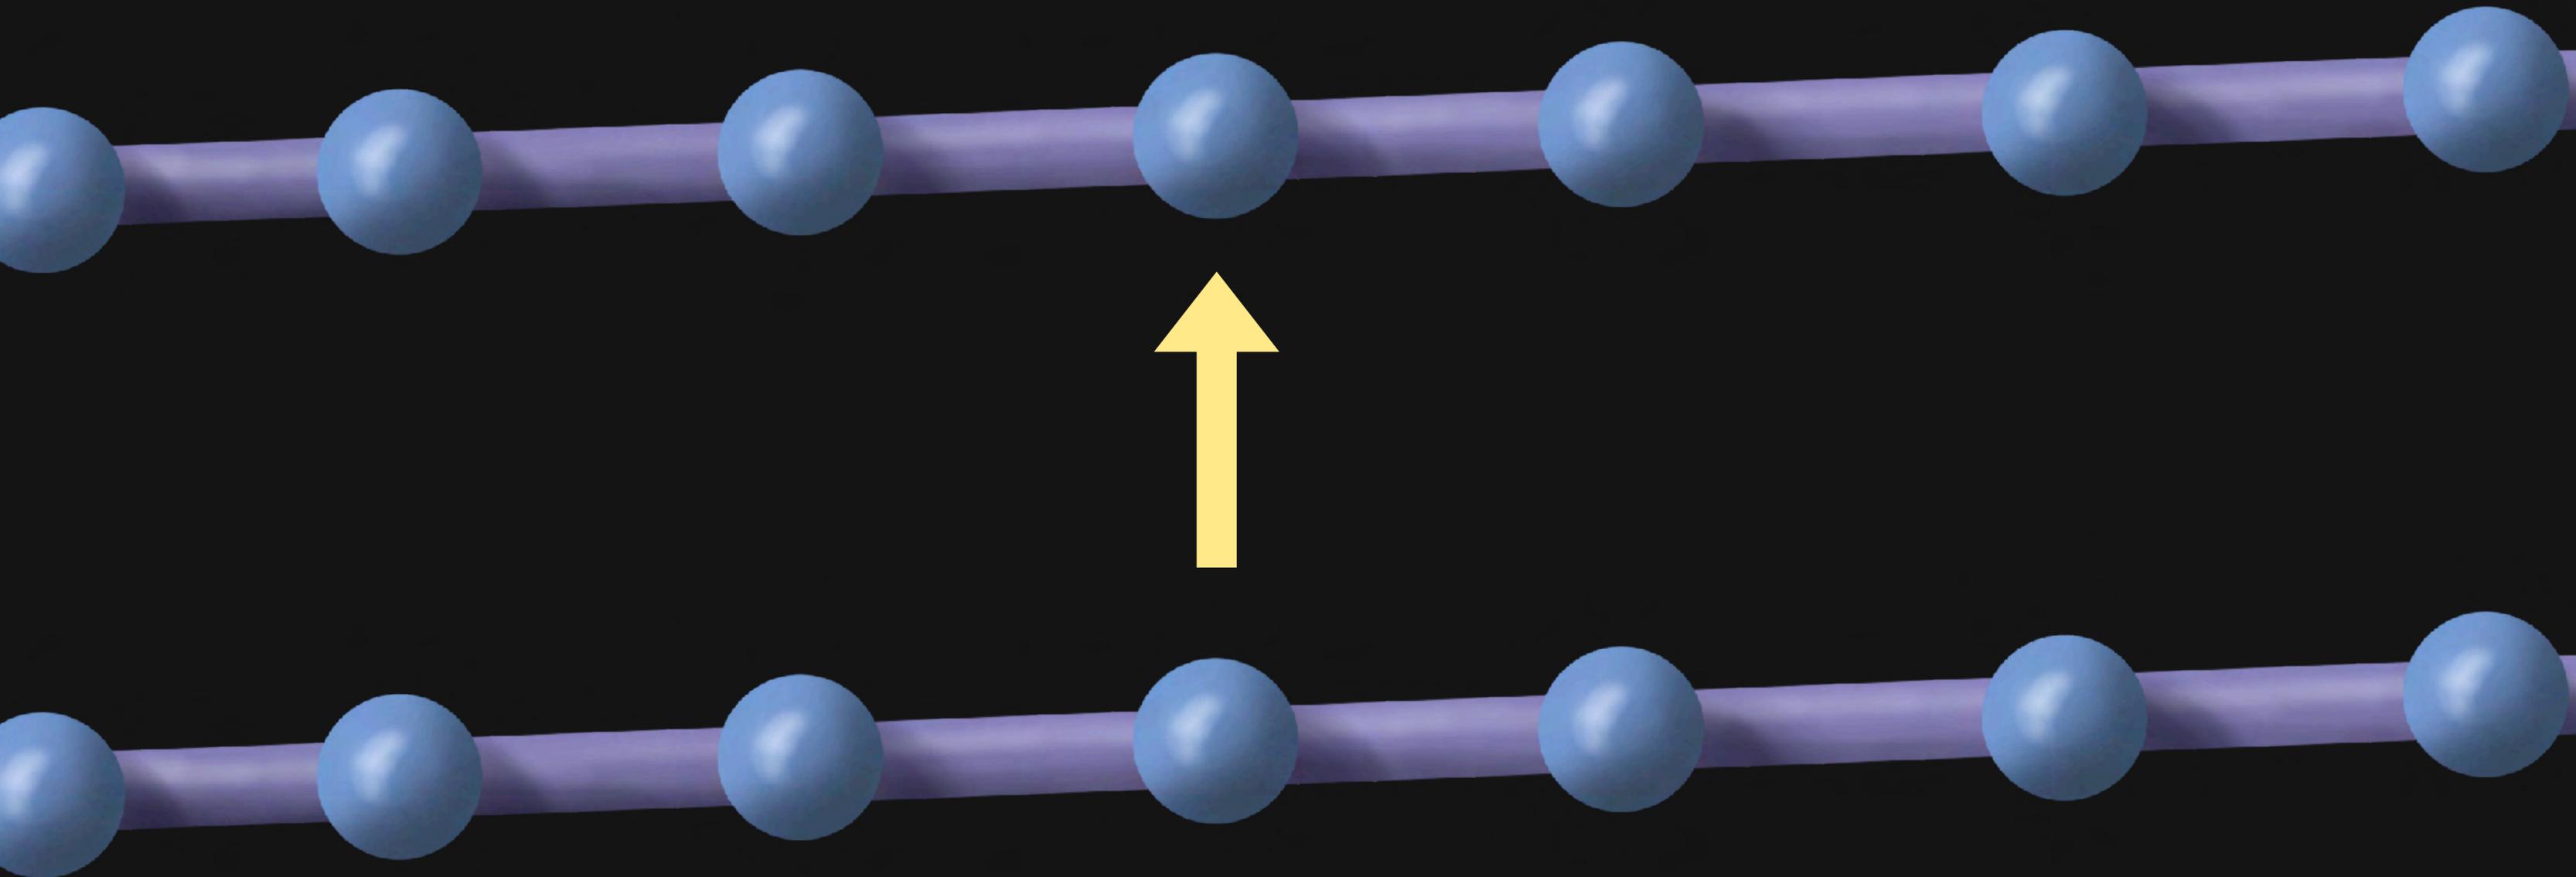

# Nothing Interesting Happens in 2 dimensions:

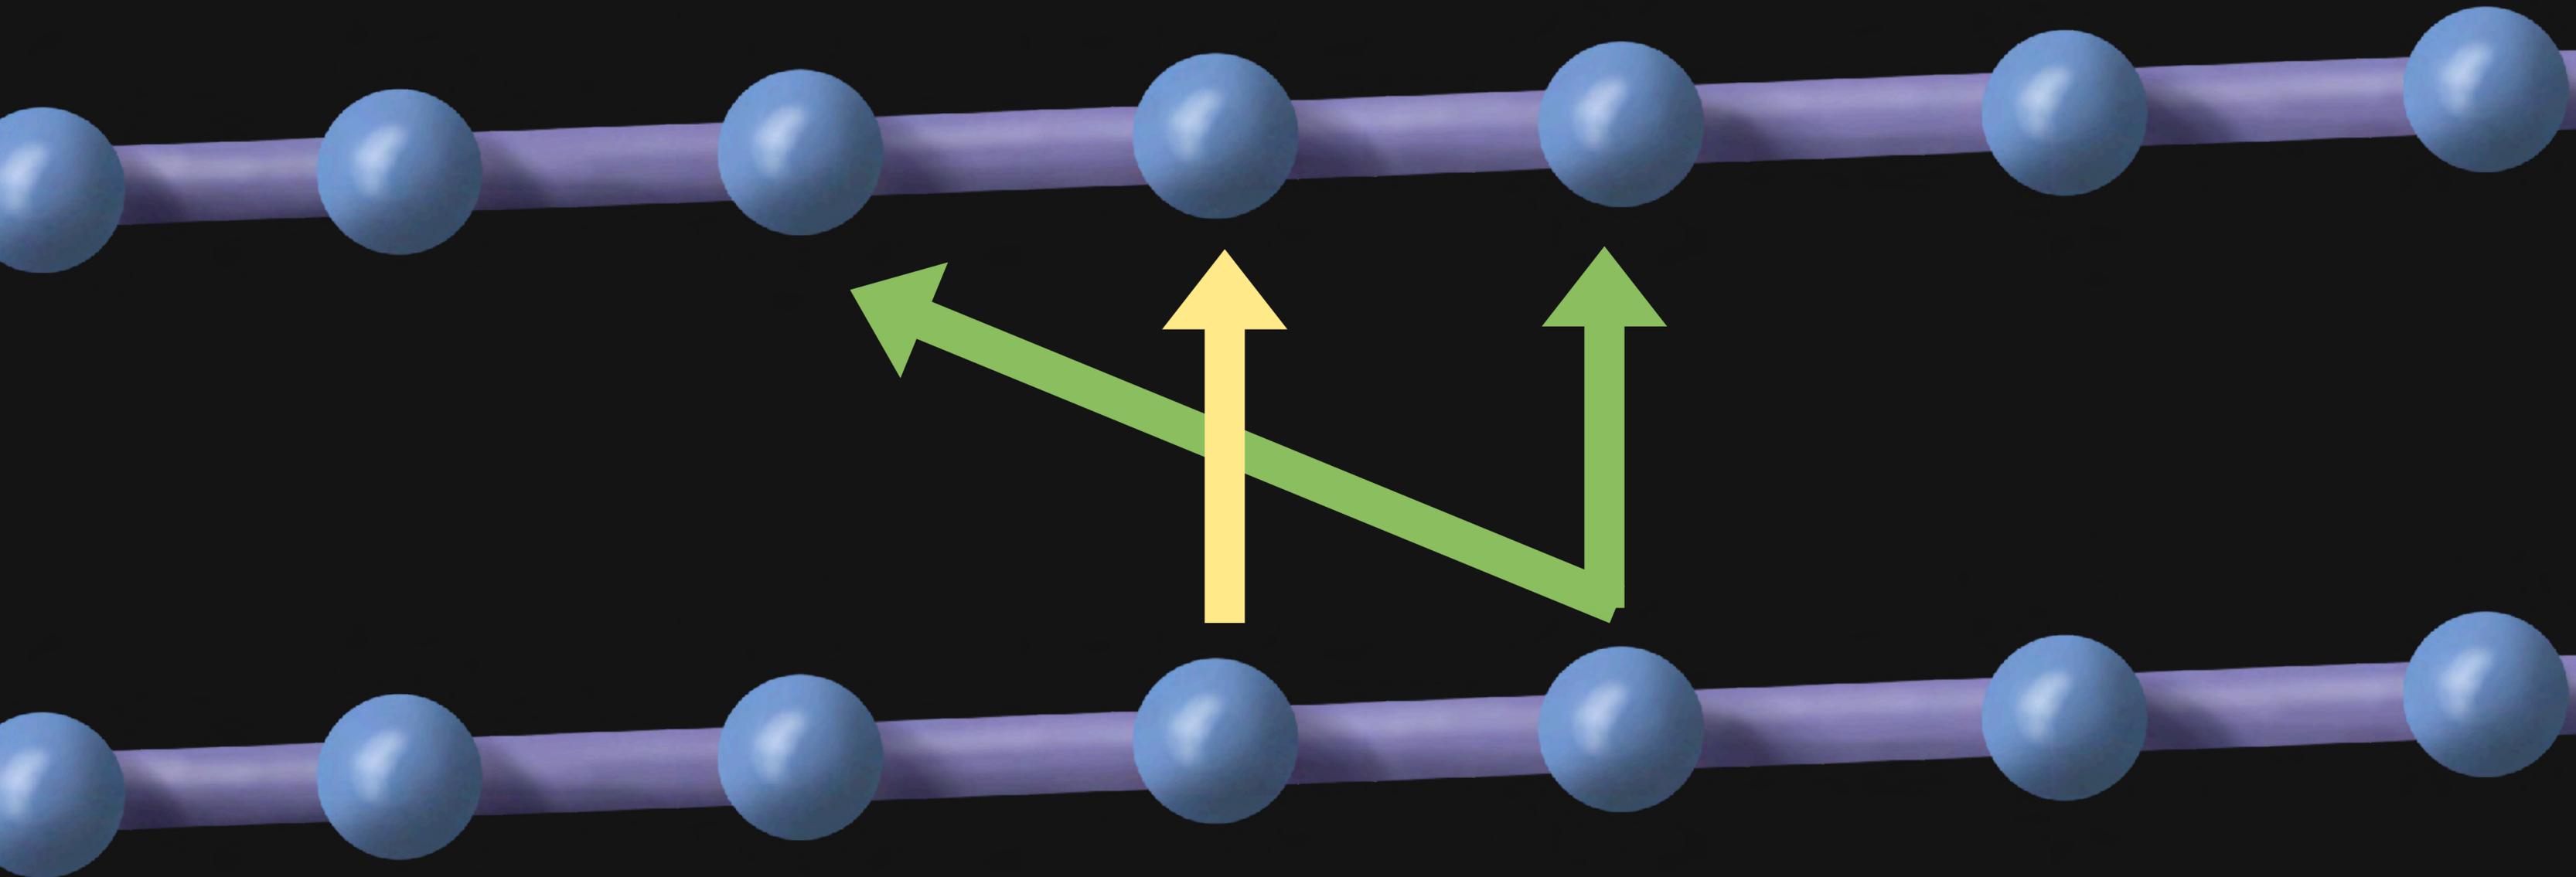

**Nothing Interesting Happens  
in 2 dimensions:**

**Nothing Interesting Happens  
in 2 dimensions:**

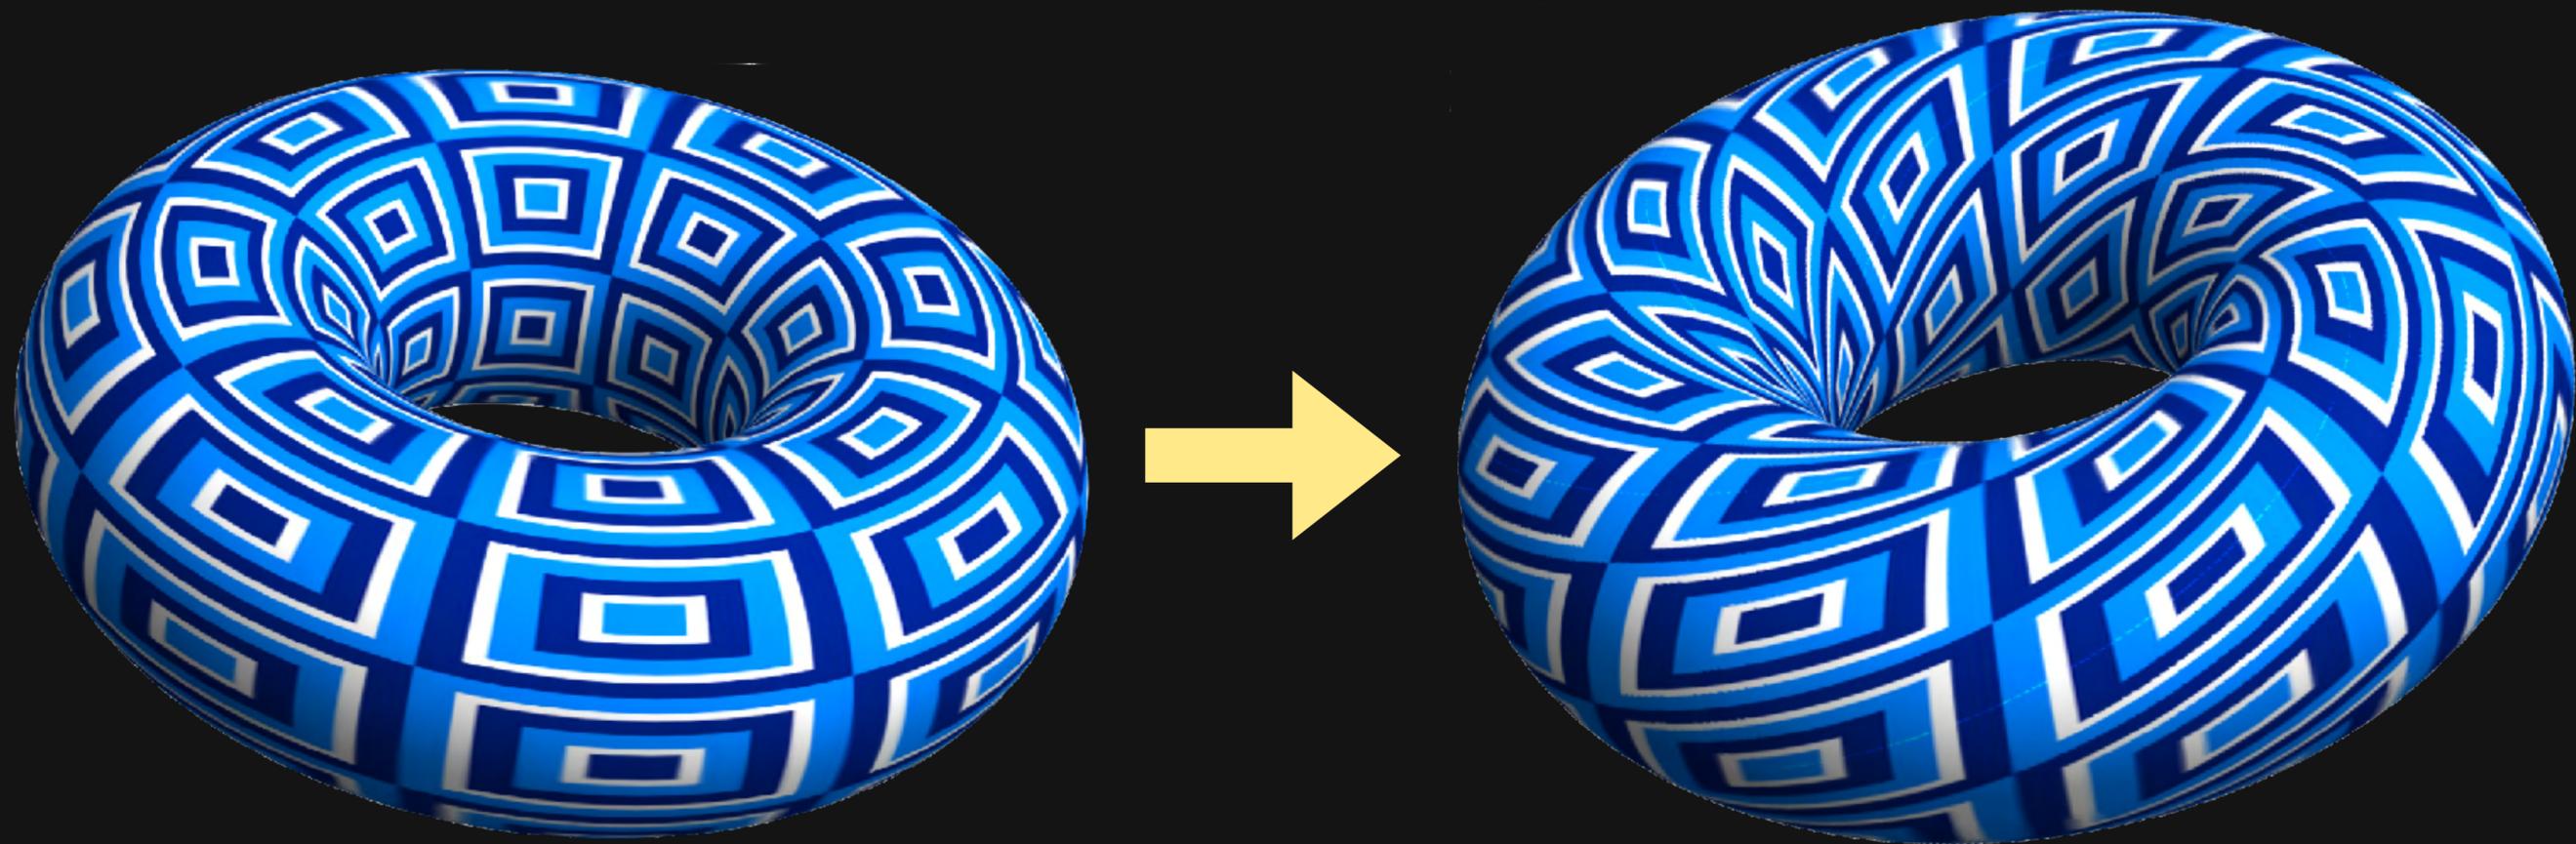

**Nothing Interesting Happens  
in 2 dimensions:**

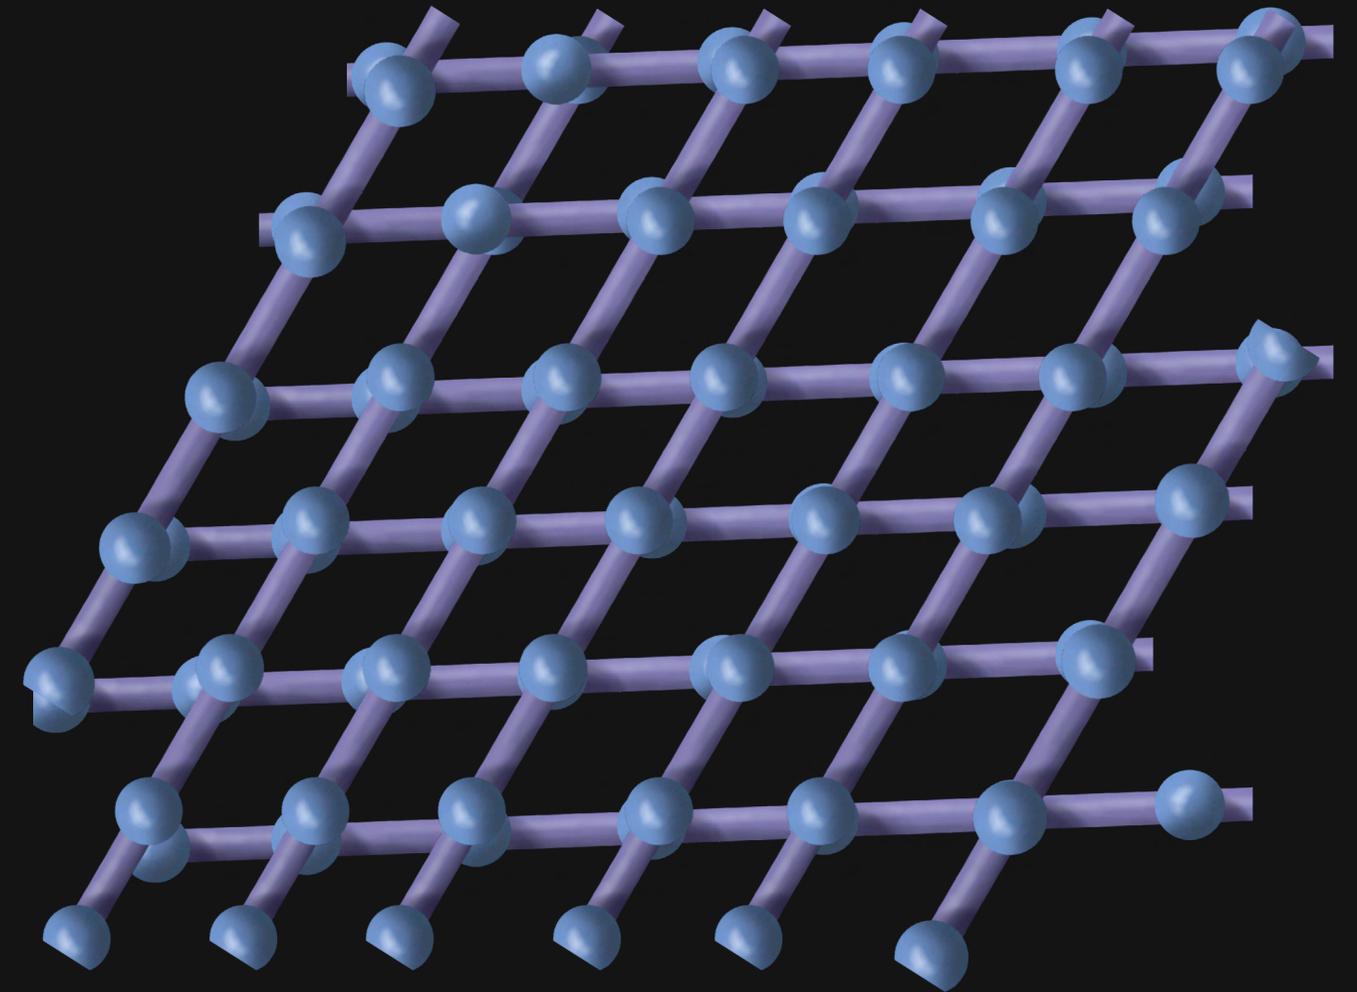

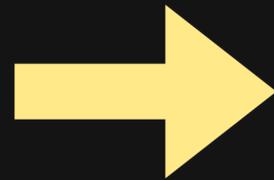

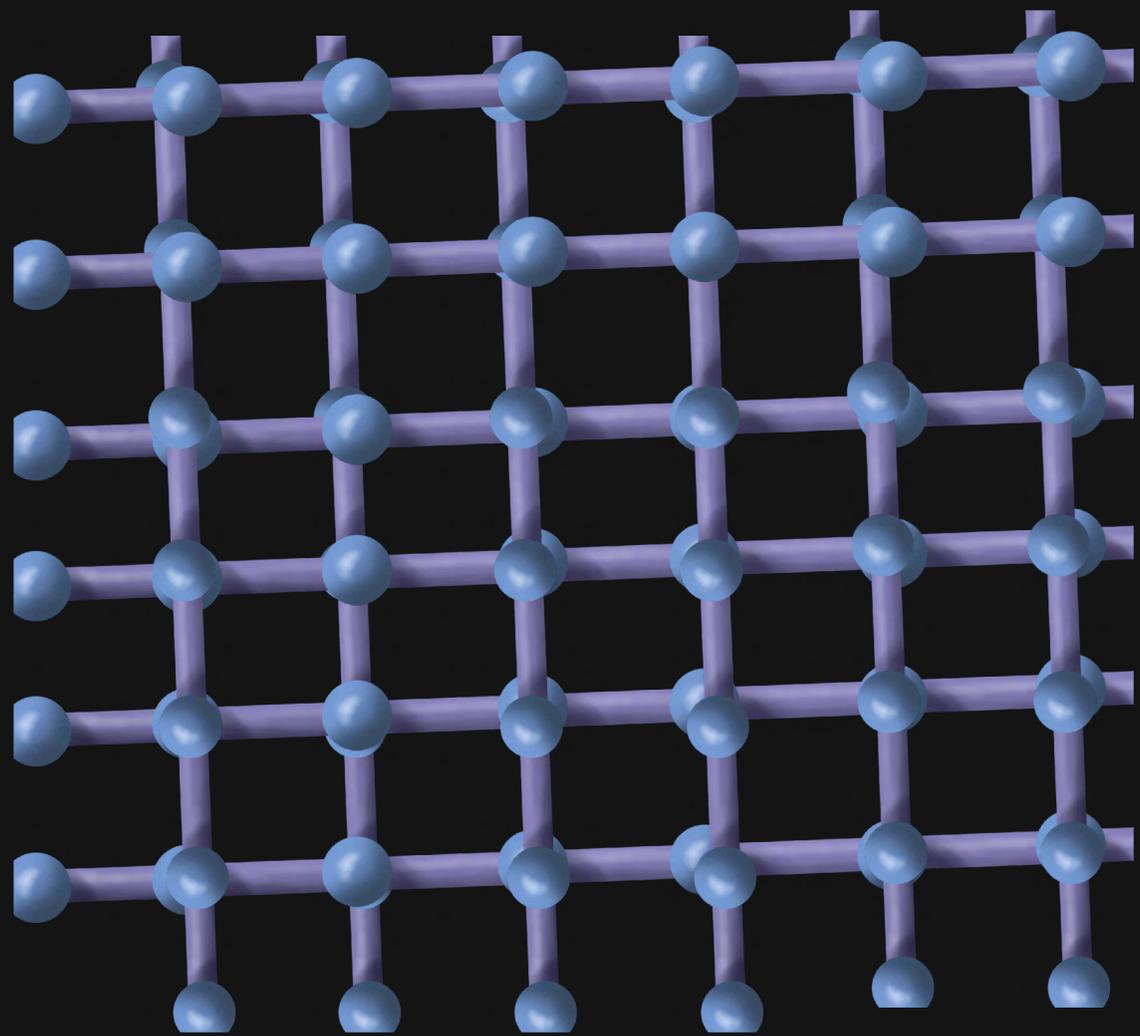

**What about in 3D?**

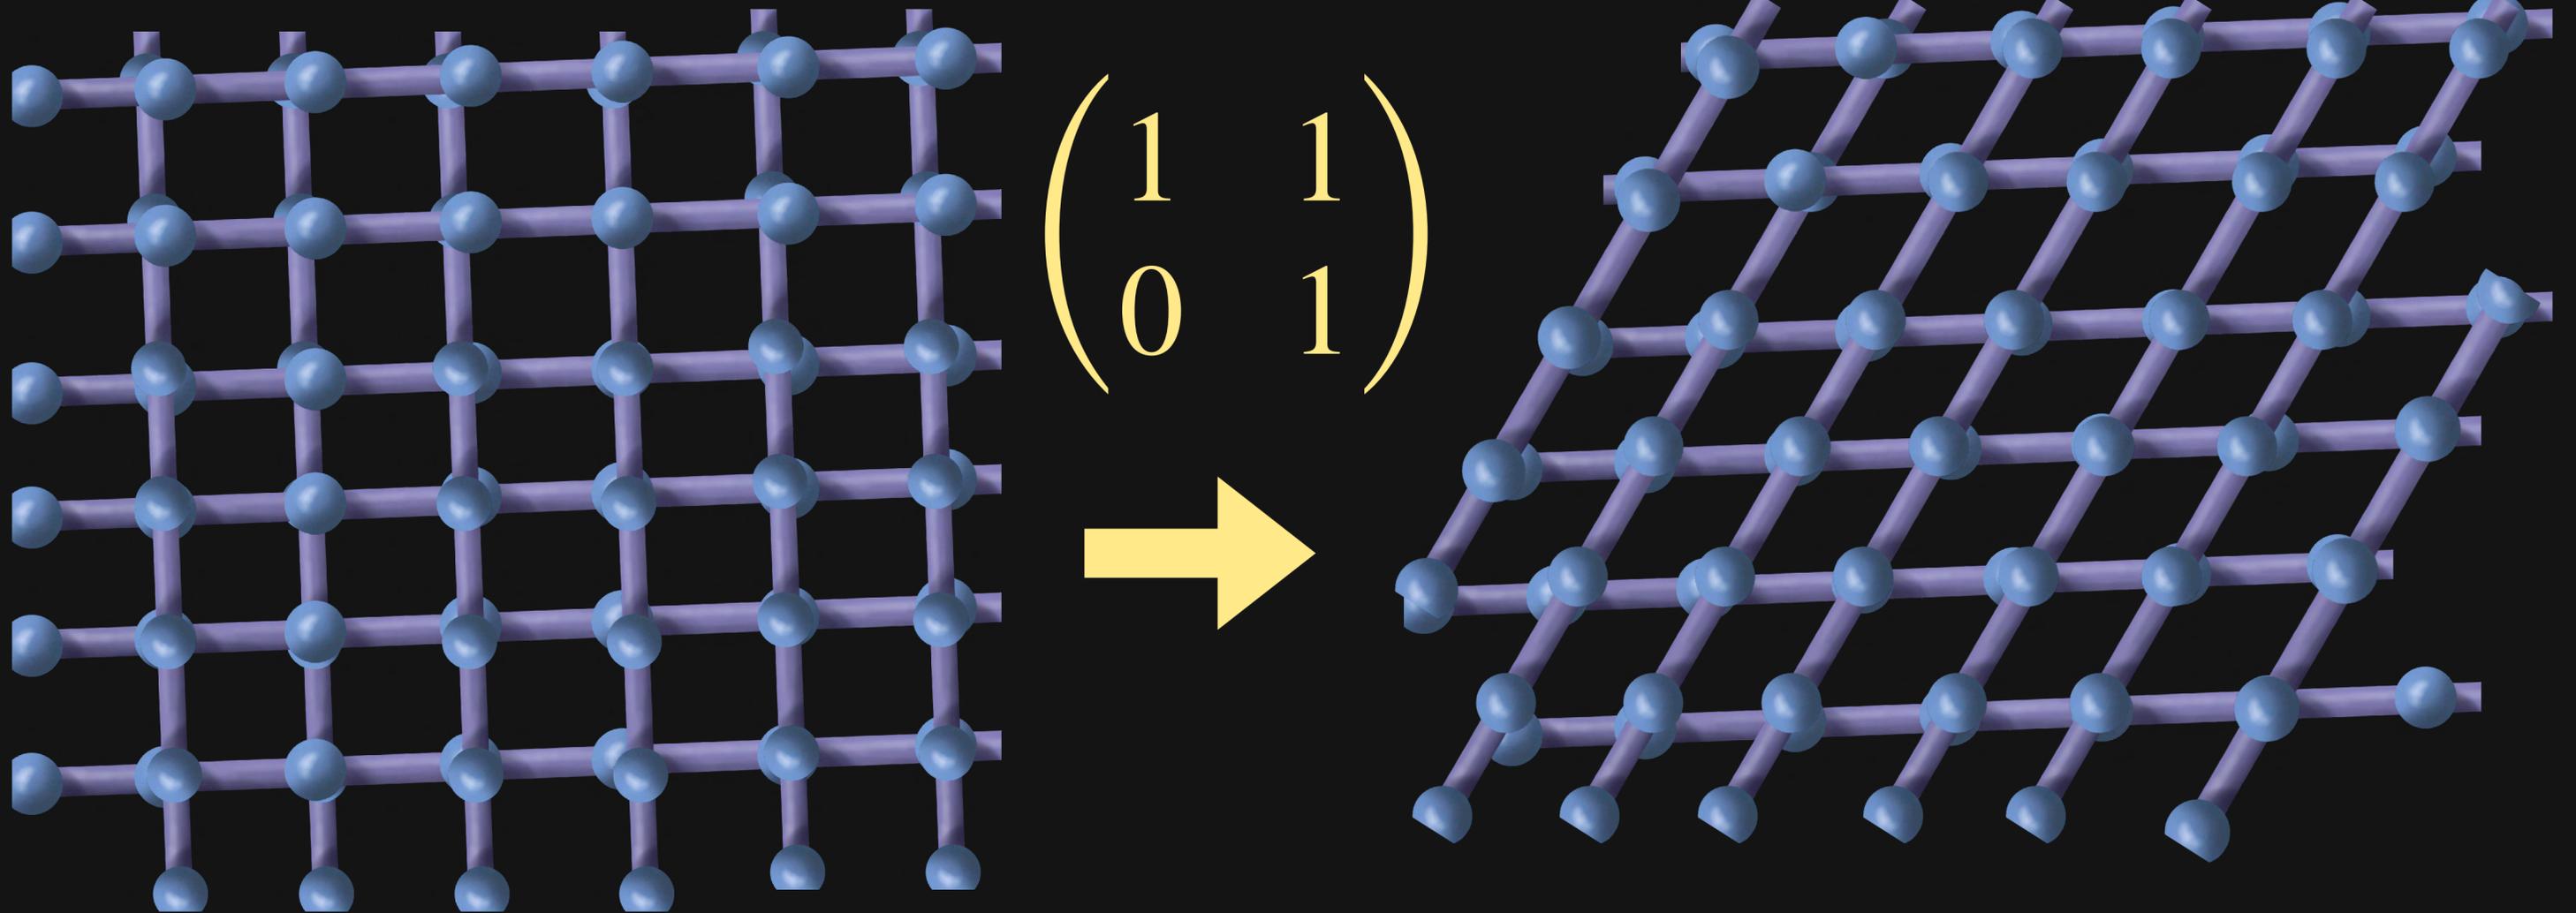

# Self-maps of a torus

# Self-maps of a torus

# Self-maps of a torus

# Self-maps of a torus

$$\begin{pmatrix} 1 & 1 \\ 0 & 1 \end{pmatrix}$$

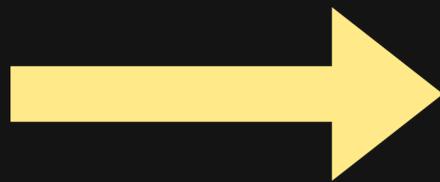

# Self-maps of a torus

The Mapping Class Group of the torus (self homeomorphisms modulo isotopy) is

$$\text{MCG}(\text{Torus}) = \text{SL}(2, \mathbb{Z})$$

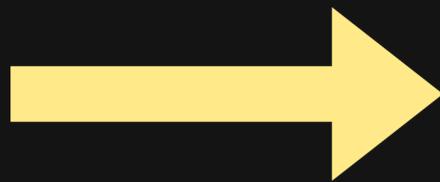

$$\begin{pmatrix} 1 & 1 \\ 0 & 1 \end{pmatrix}$$

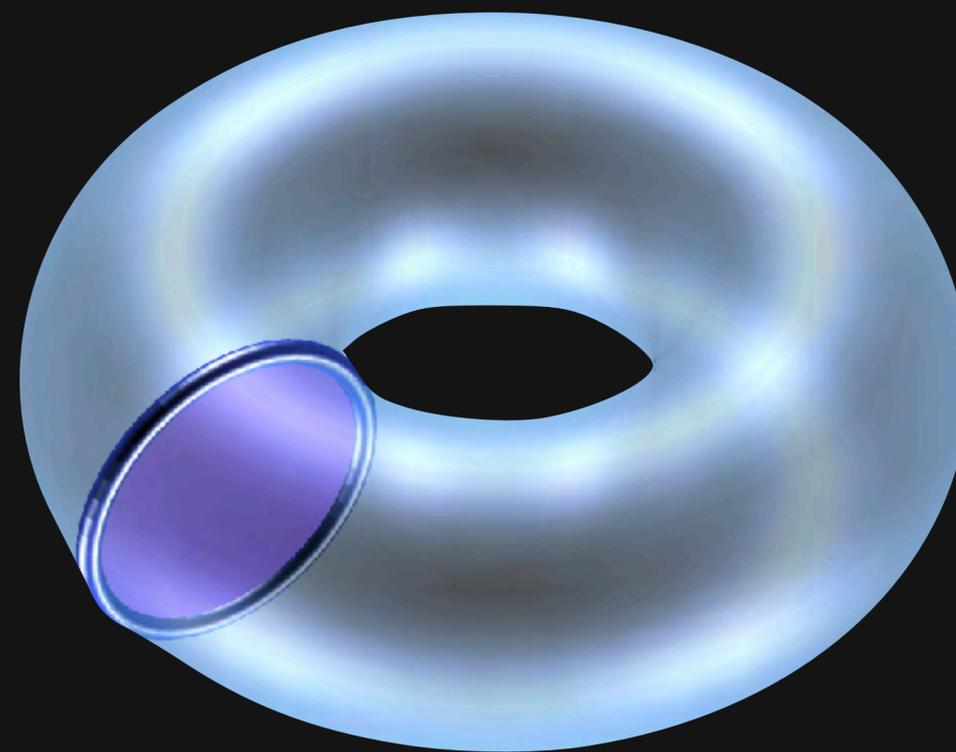

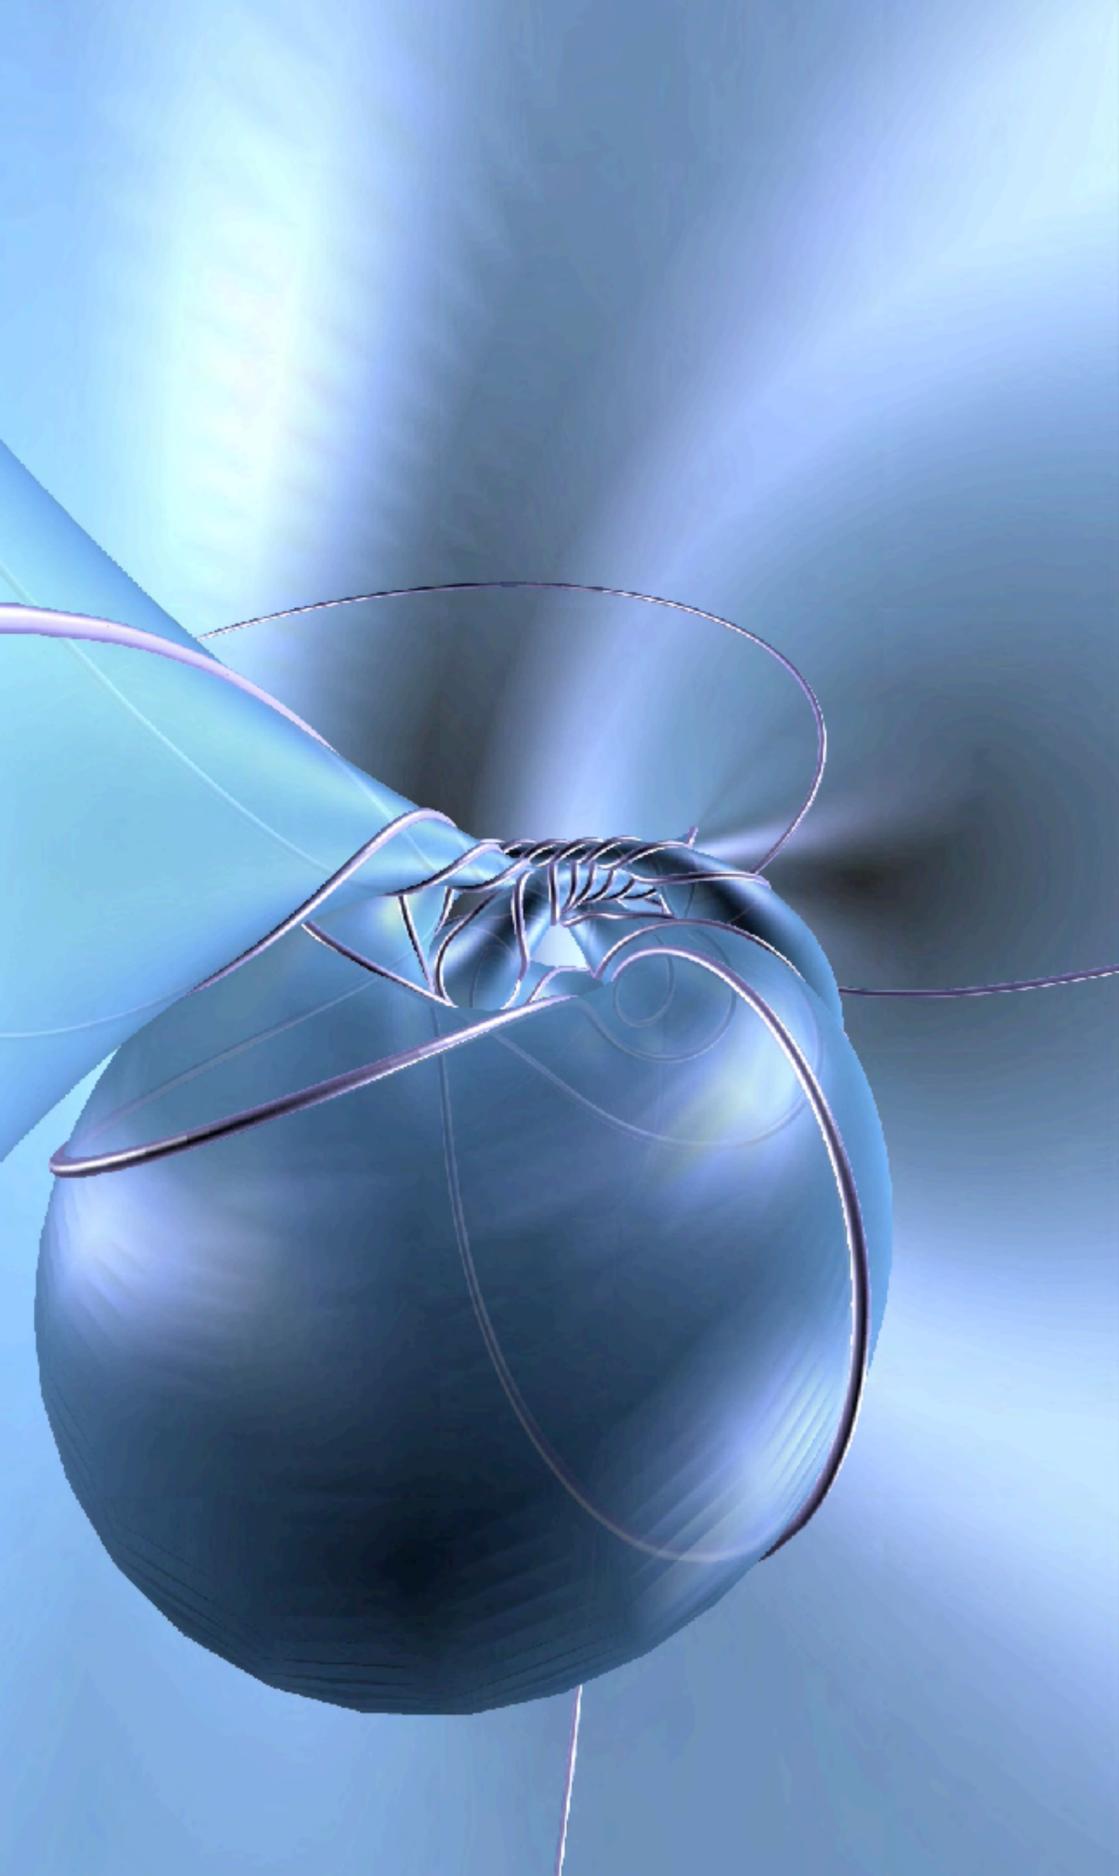

$$\begin{pmatrix} 2 & 1 \\ 1 & 1 \end{pmatrix}$$

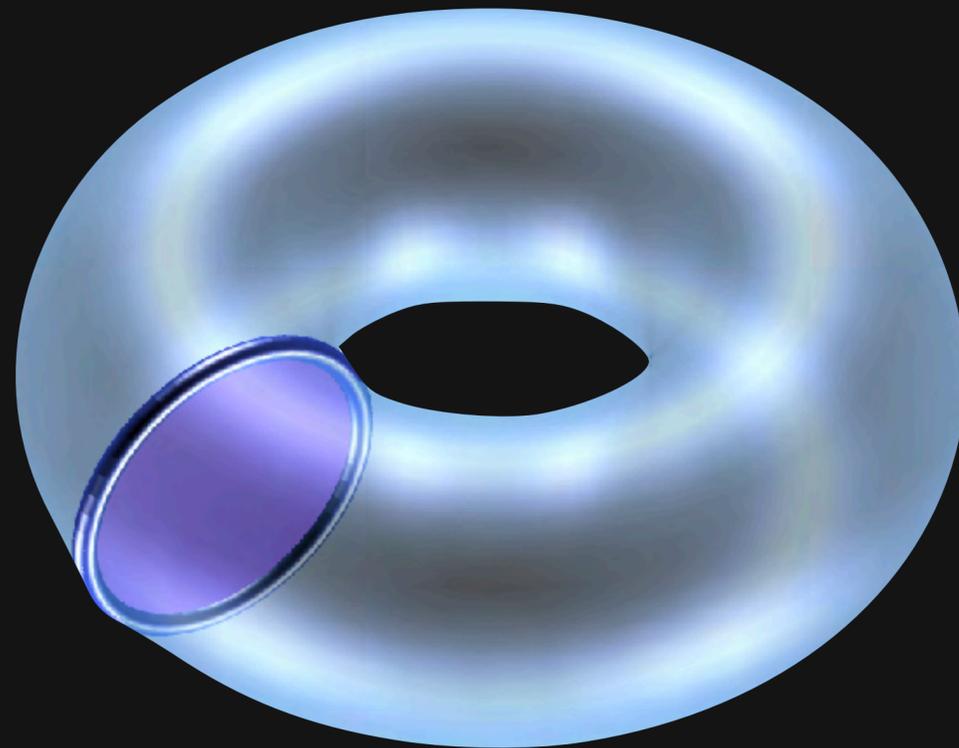

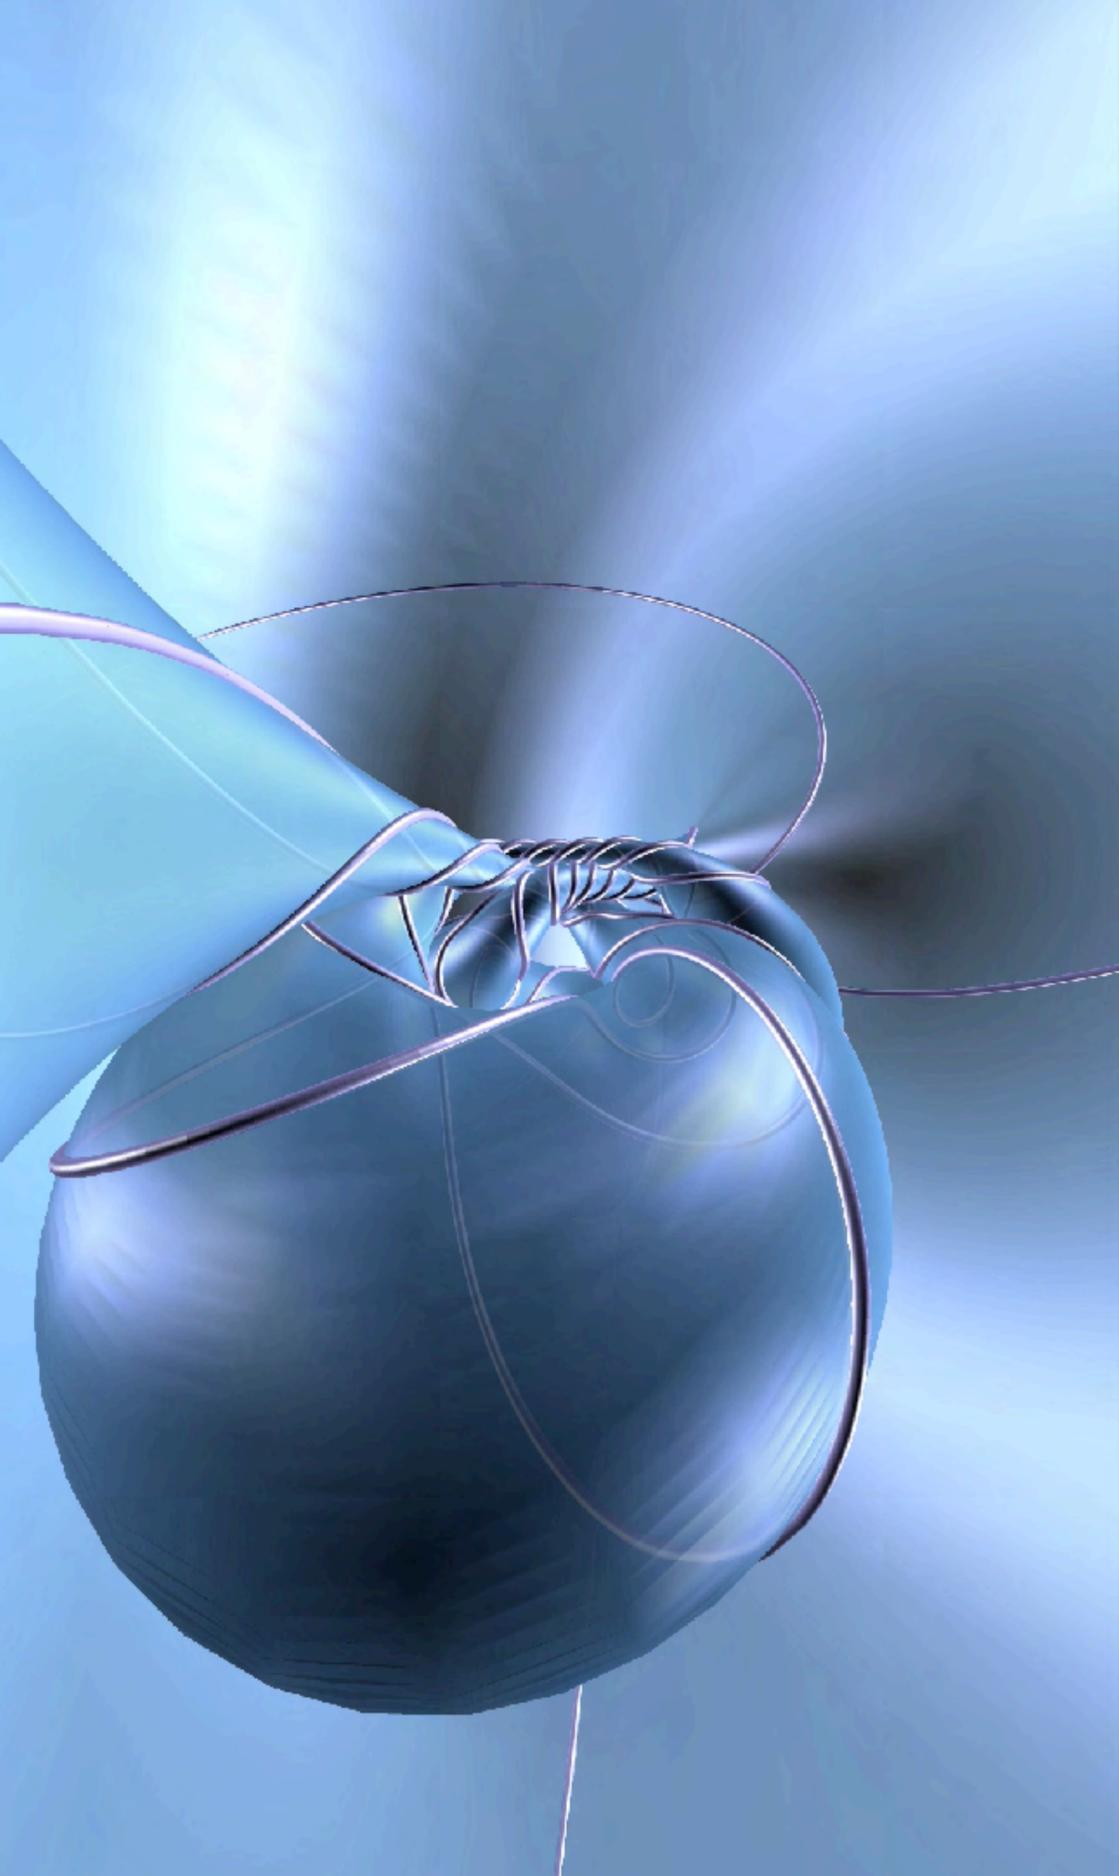

**What does this look like?**

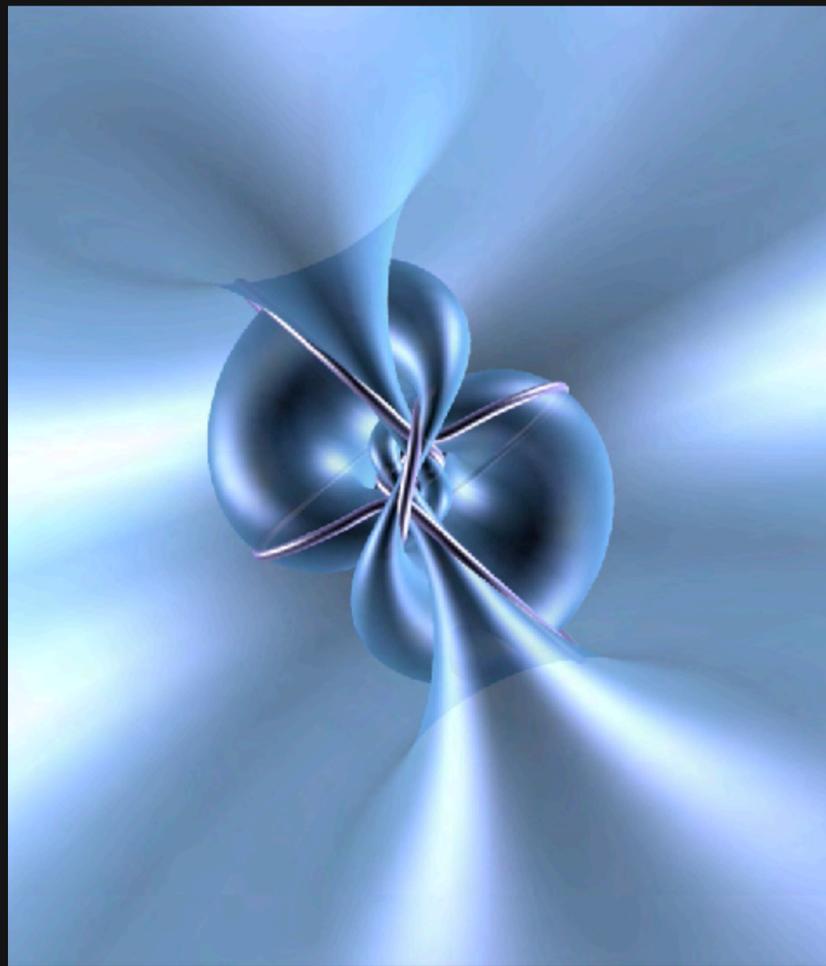

**Effect on Fundamental group:**

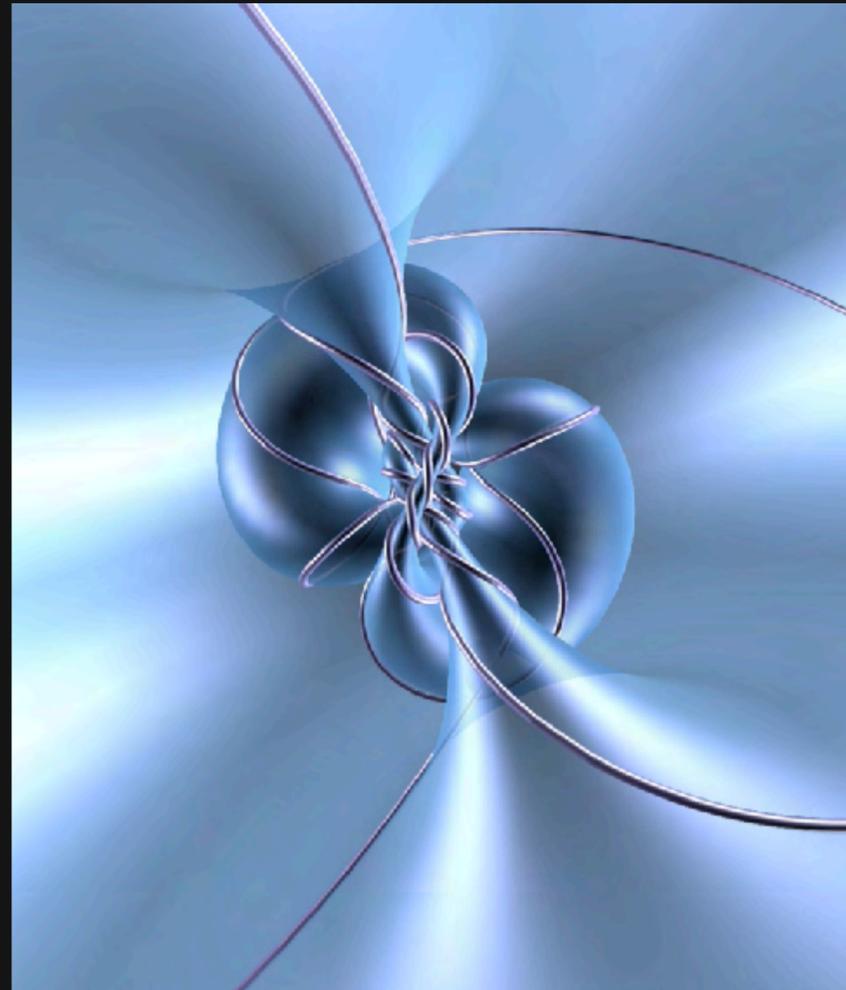

**The loop on the left hand side becomes contractible!**

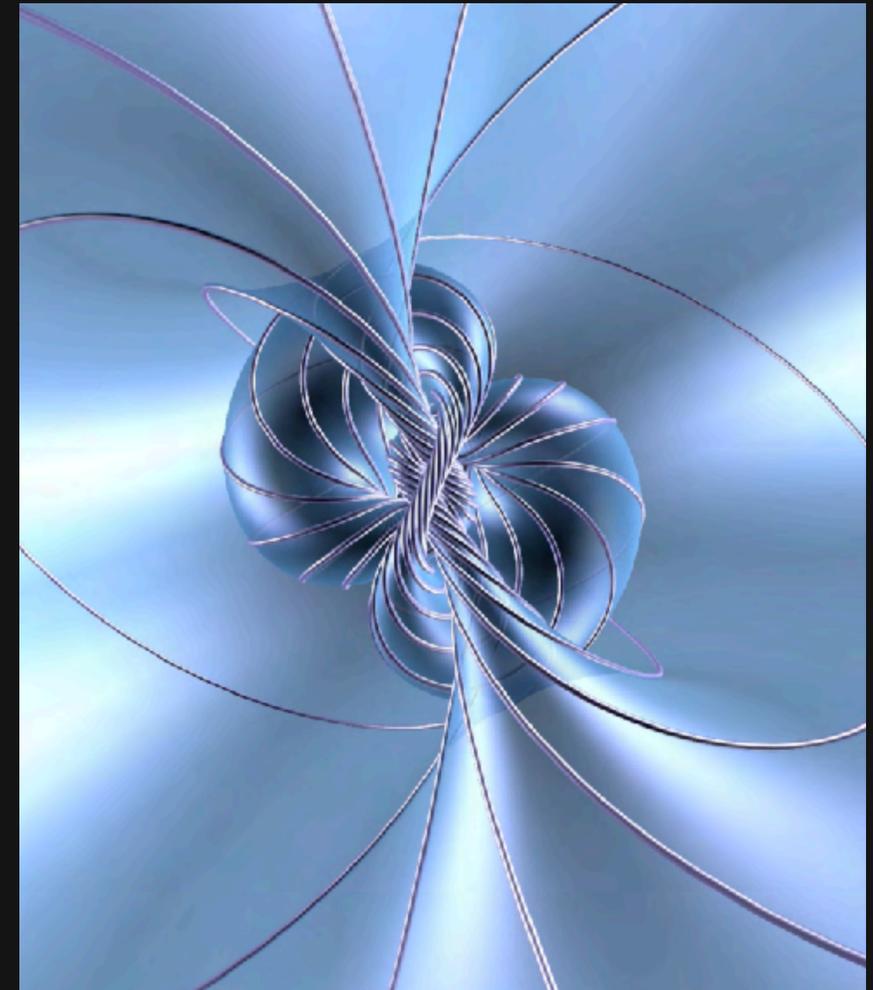

**For each knot, this gives us an infinity of different closed manifolds!**

**5/1**

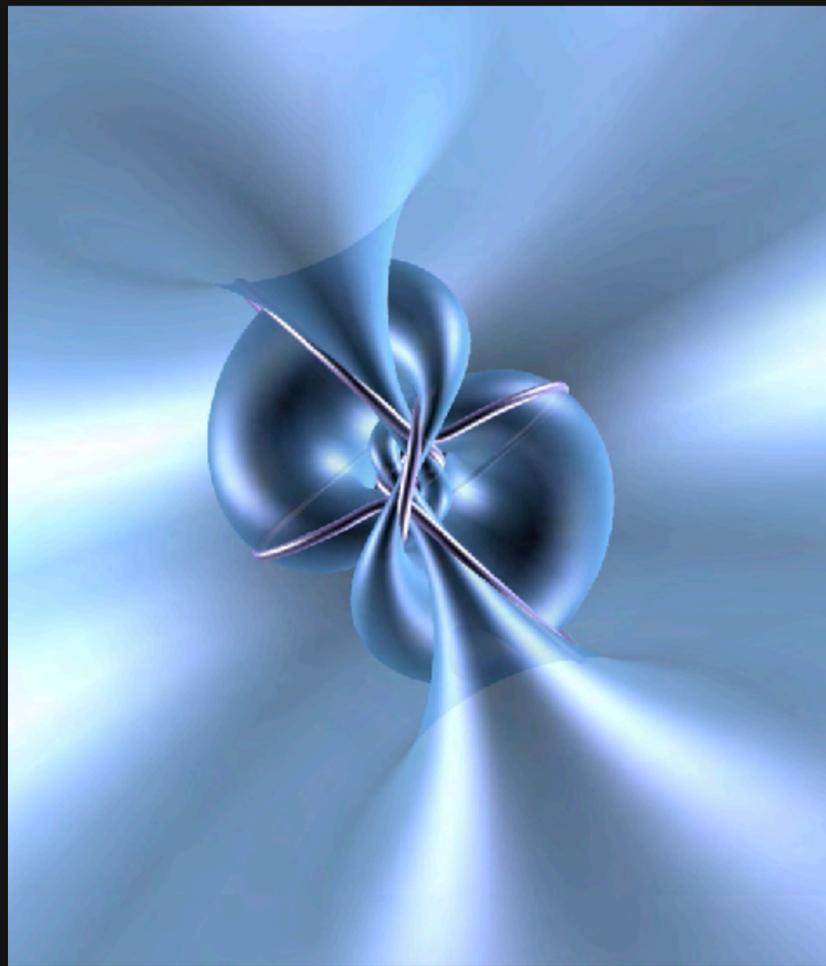

**21/2**

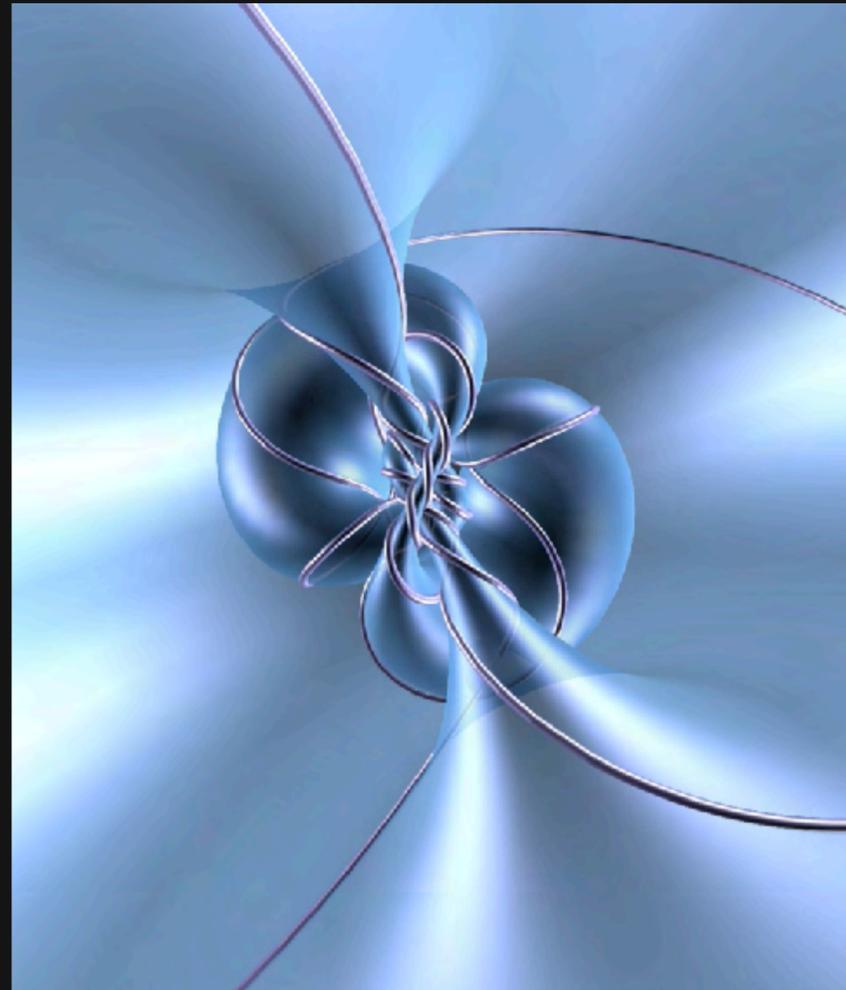

**55/7**

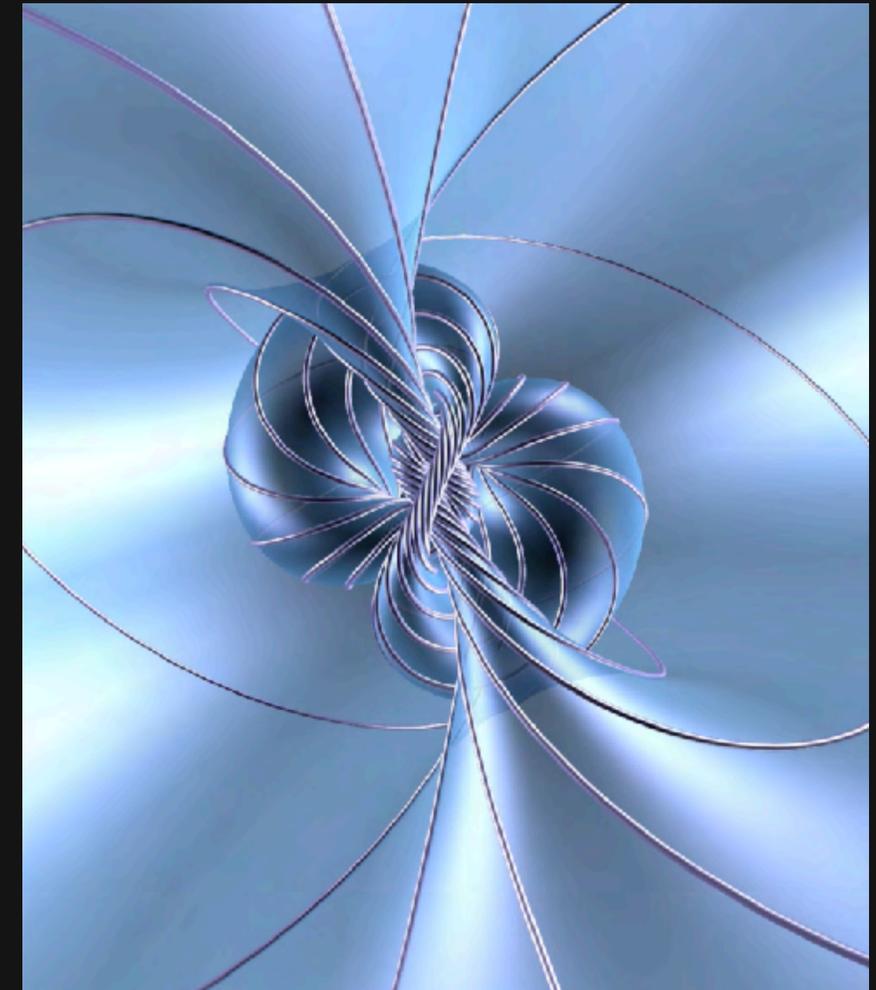

**These are parameterized by a rational number, the "slope" of the gluing map**

**5/1**

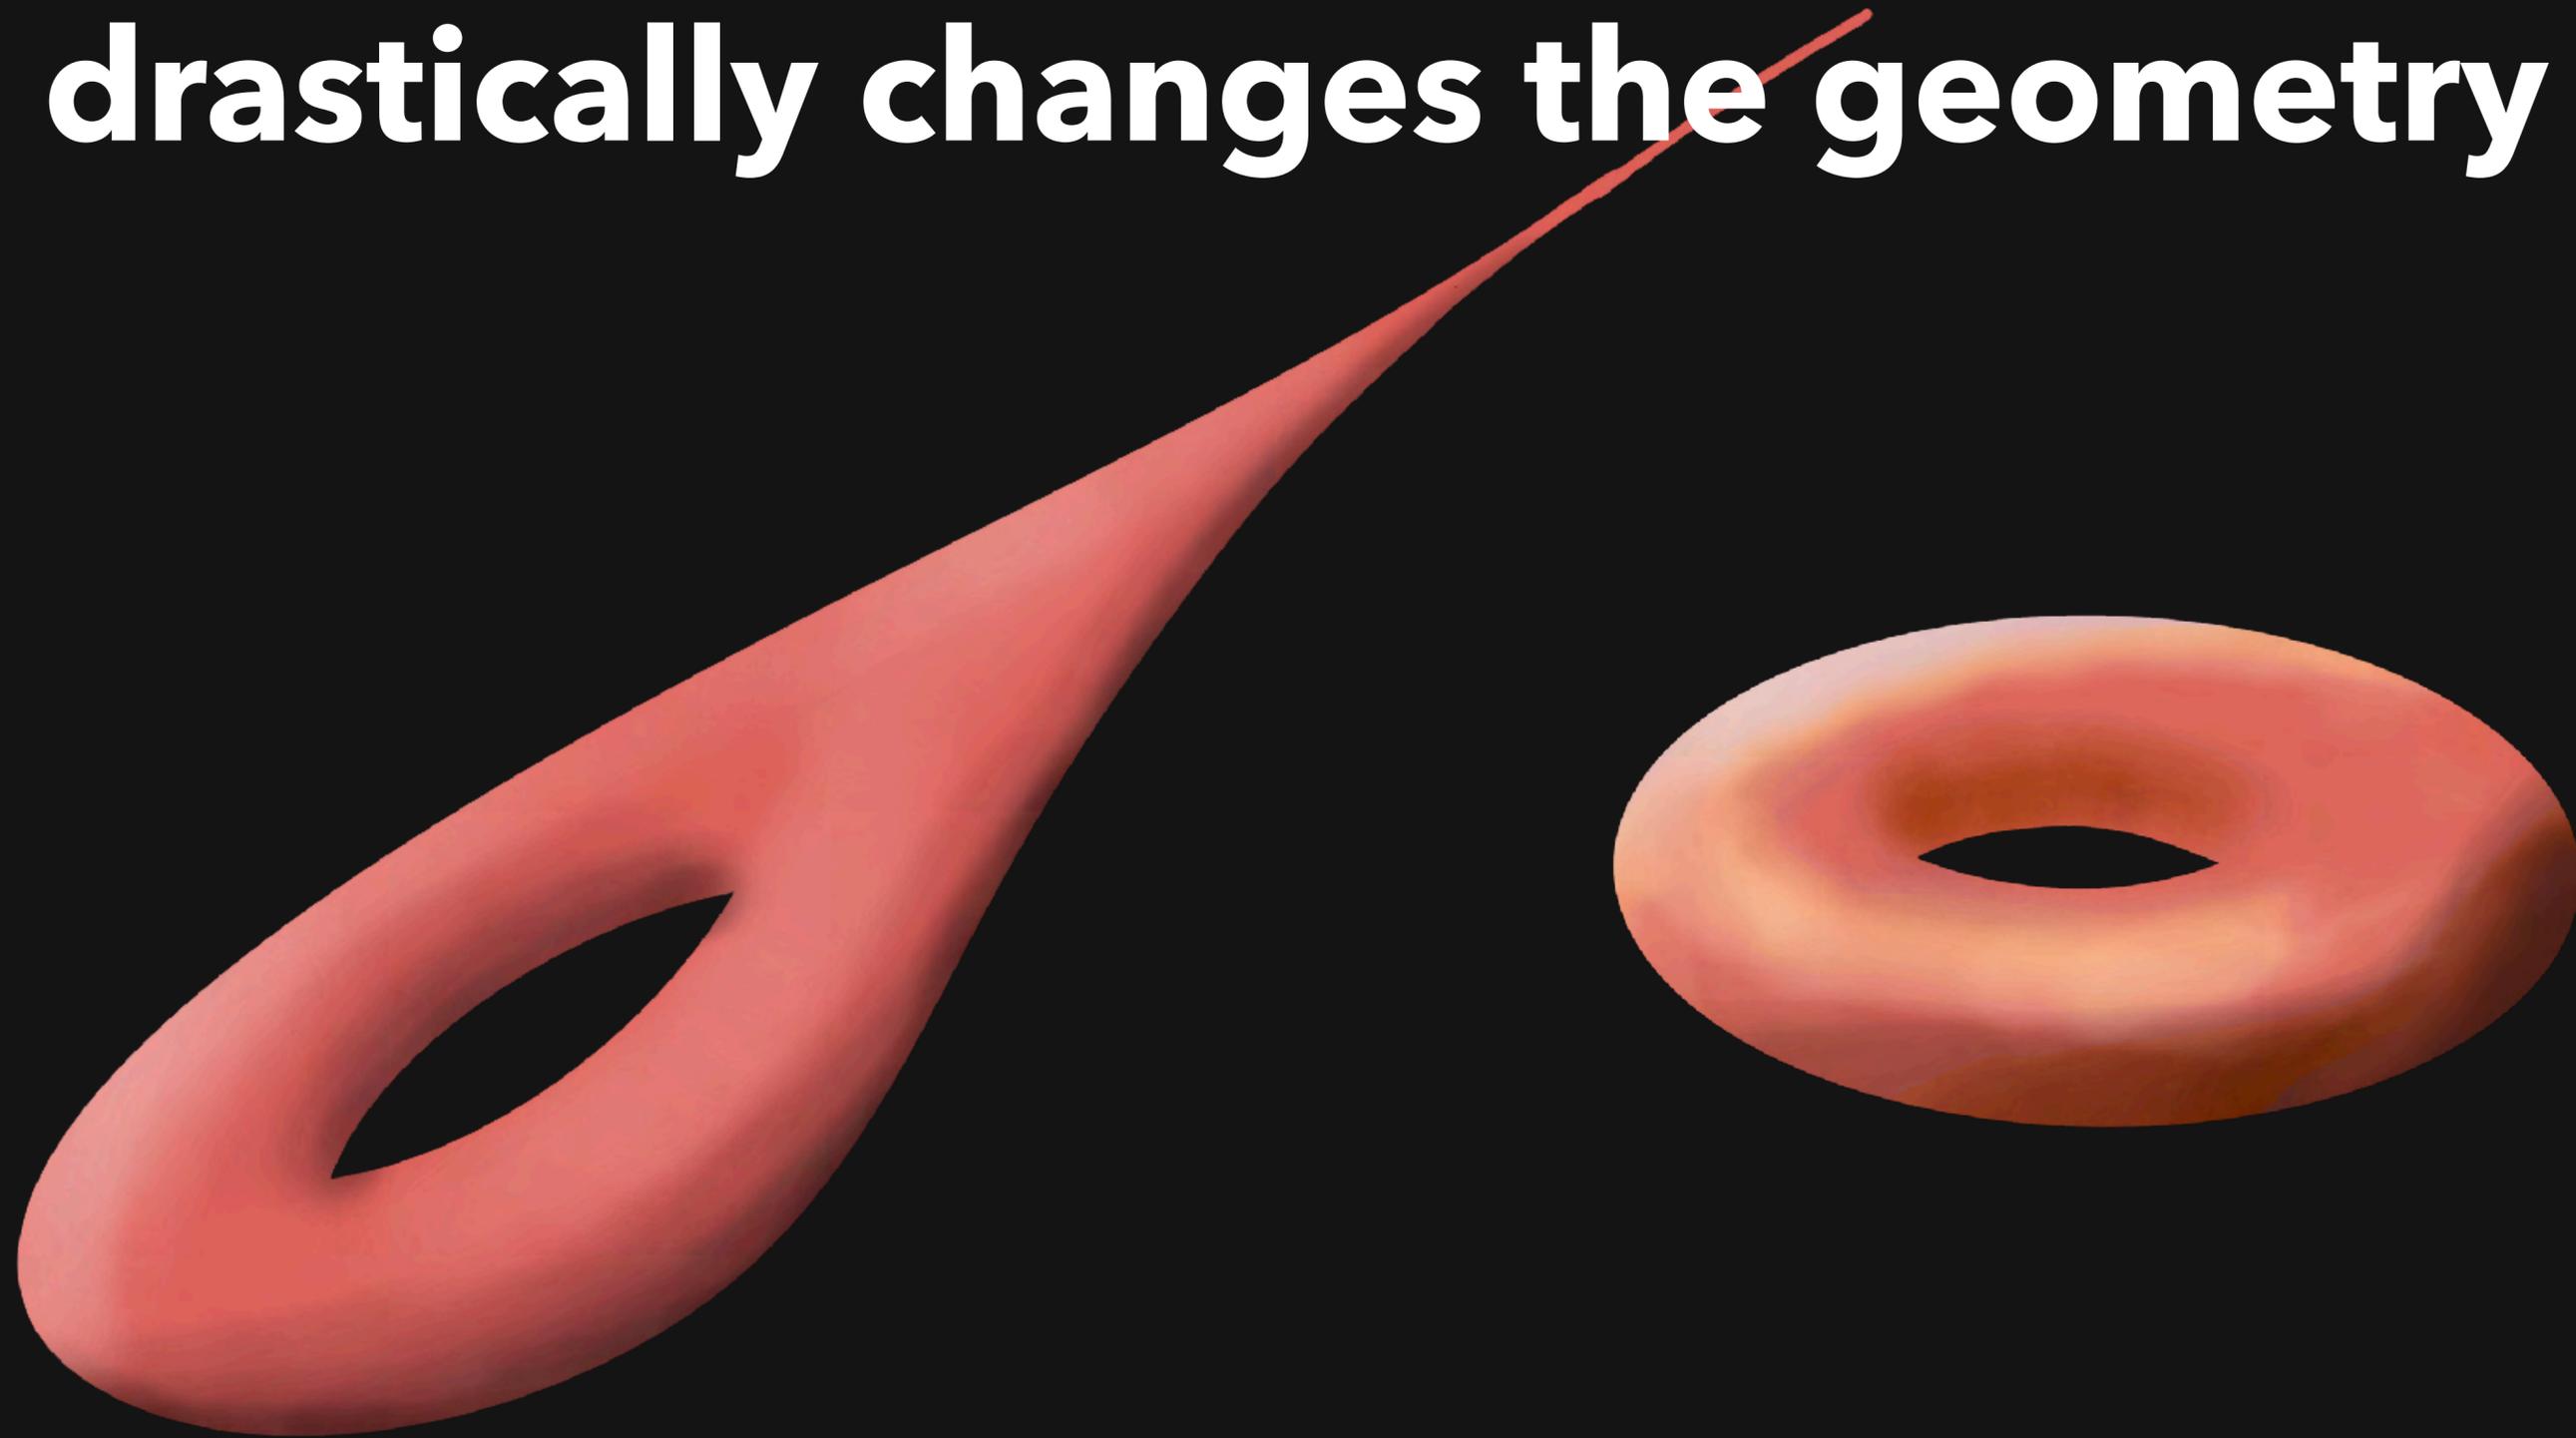

**21/2**

**55/7**

**What does this do to the  
geometry?!?**

**Dimension 2: filling the puncture  
drastically changes the geometry**

**Dehn filling doesn't even  
KNOW about geometry!**

**Why should it matter that the  
manifold we started with was  
hyperbolic?**

# Using a computer (Snappy) we can now just be brave and give it a try!

## `dehn_fill(filling_data, which_cusp=None)`

Set the Dehn filling coefficients of the cusps. This can be specified in the following ways, where the cusps are numbered by  $0, 1, \dots, (\text{num\_cusps} - 1)$ .

- Fill cusp 2:

```
>>> M = Manifold('8^4_1')
>>> M.dehn_fill((2,3), 2)
>>> M
8^4_1(0,0)(0,0)(2,3)(0,0)
```

- Fill the last cusp:

```
>>> M.dehn_fill((1,5), -1)
>>> M
8^4_1(0,0)(0,0)(2,3)(1,5)
```

- Fill the first two cusps:

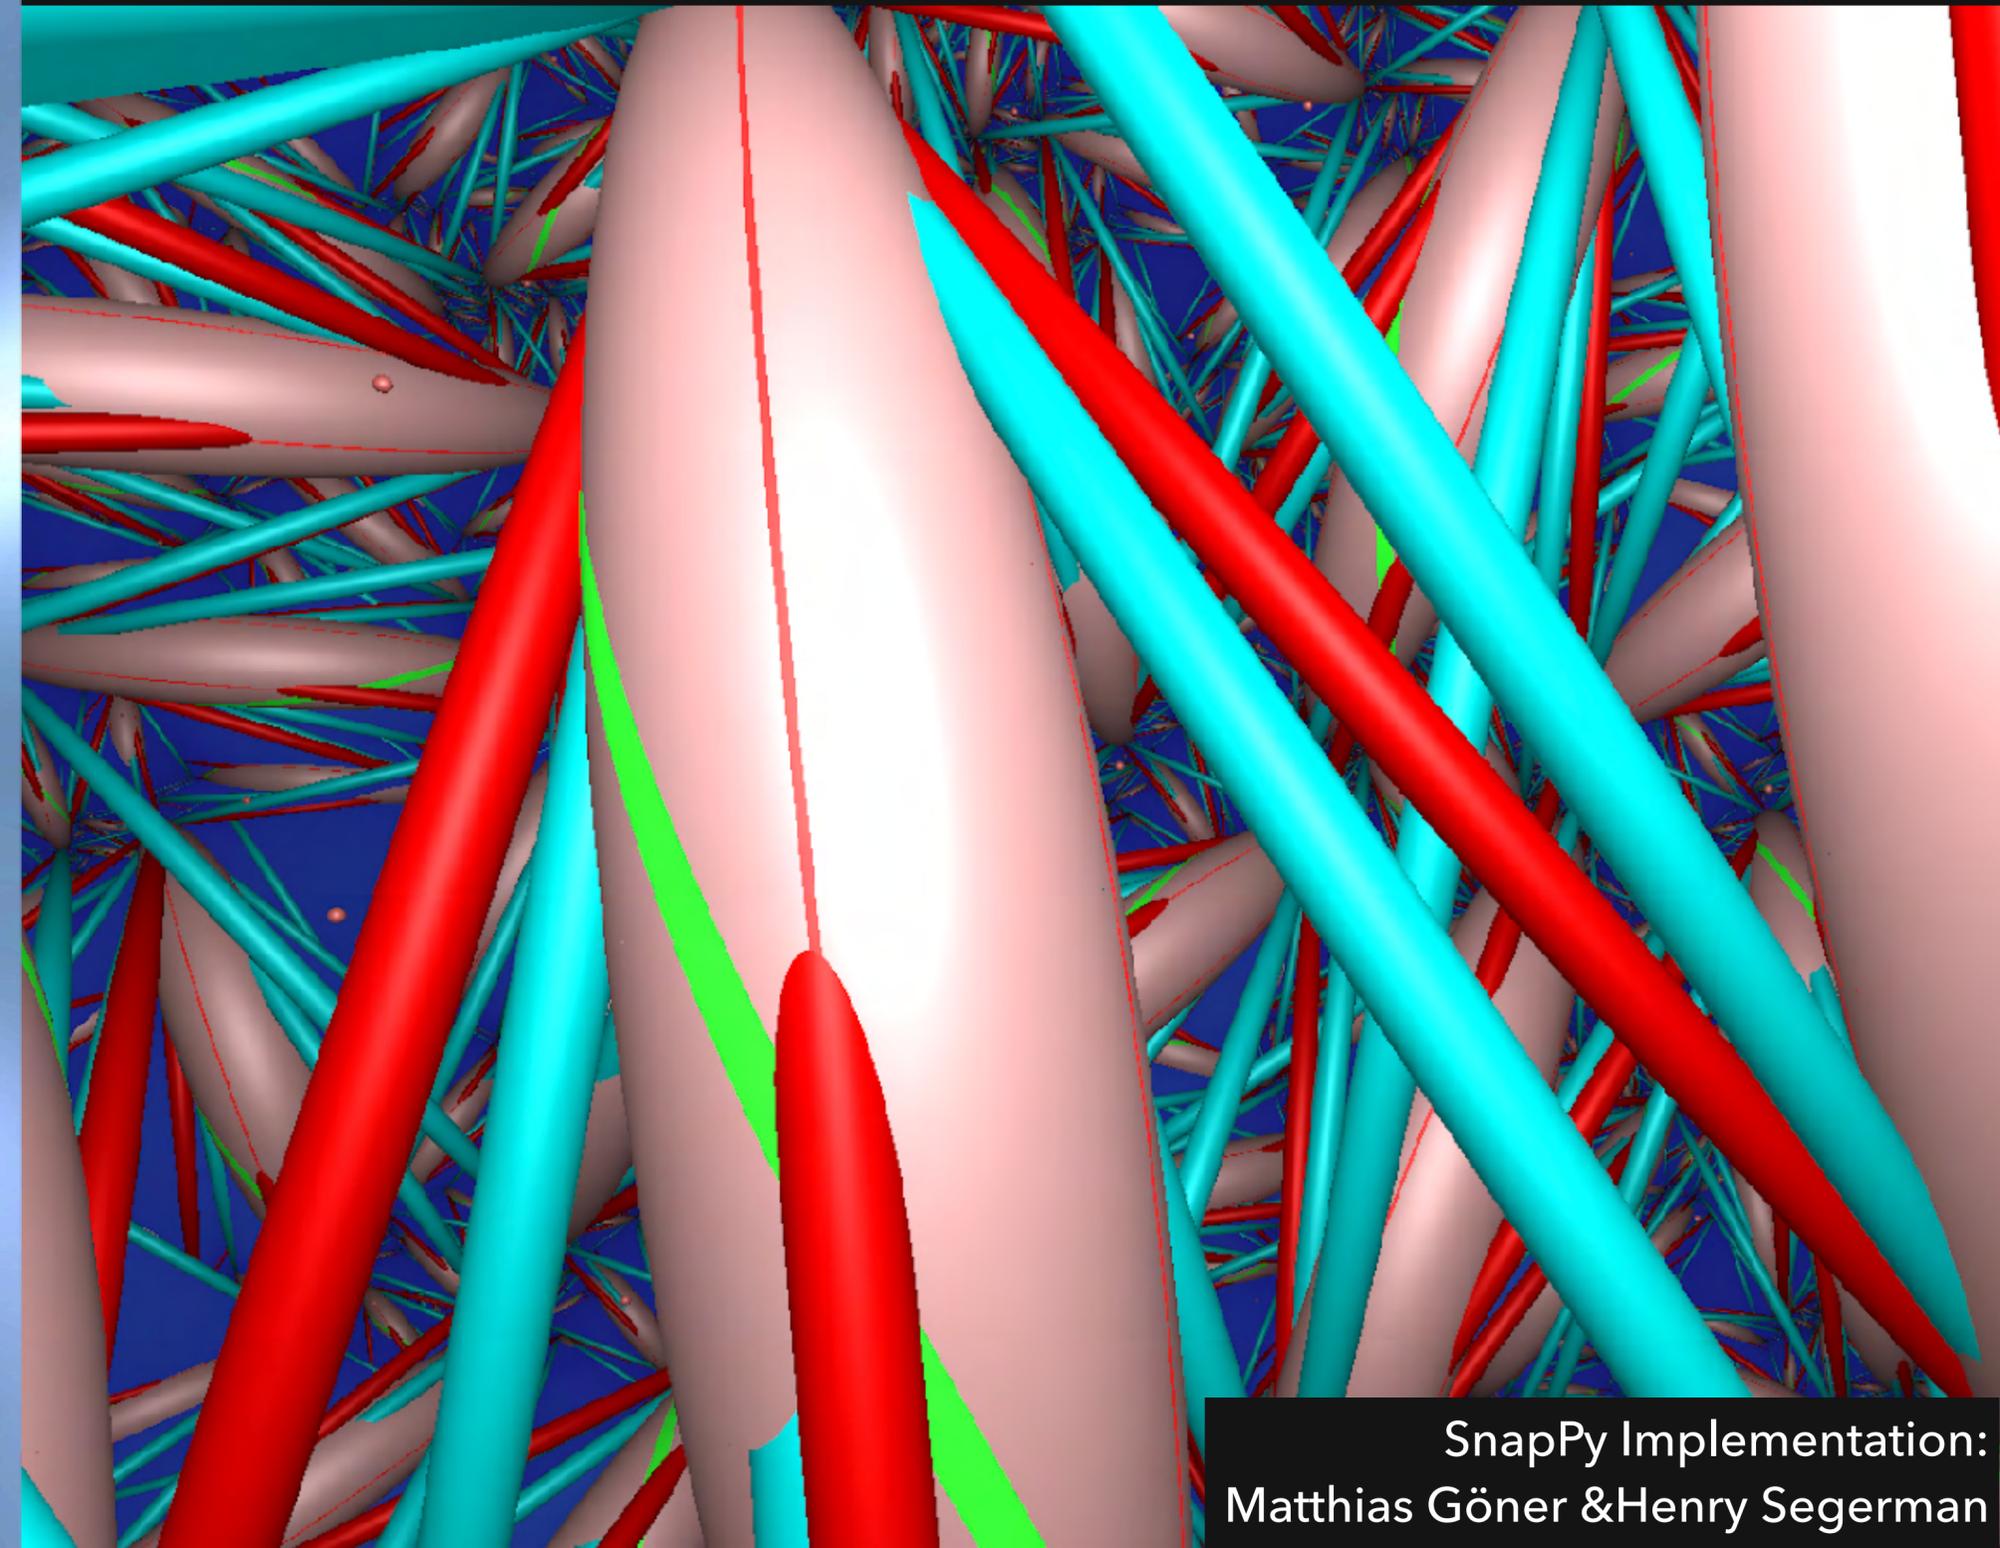

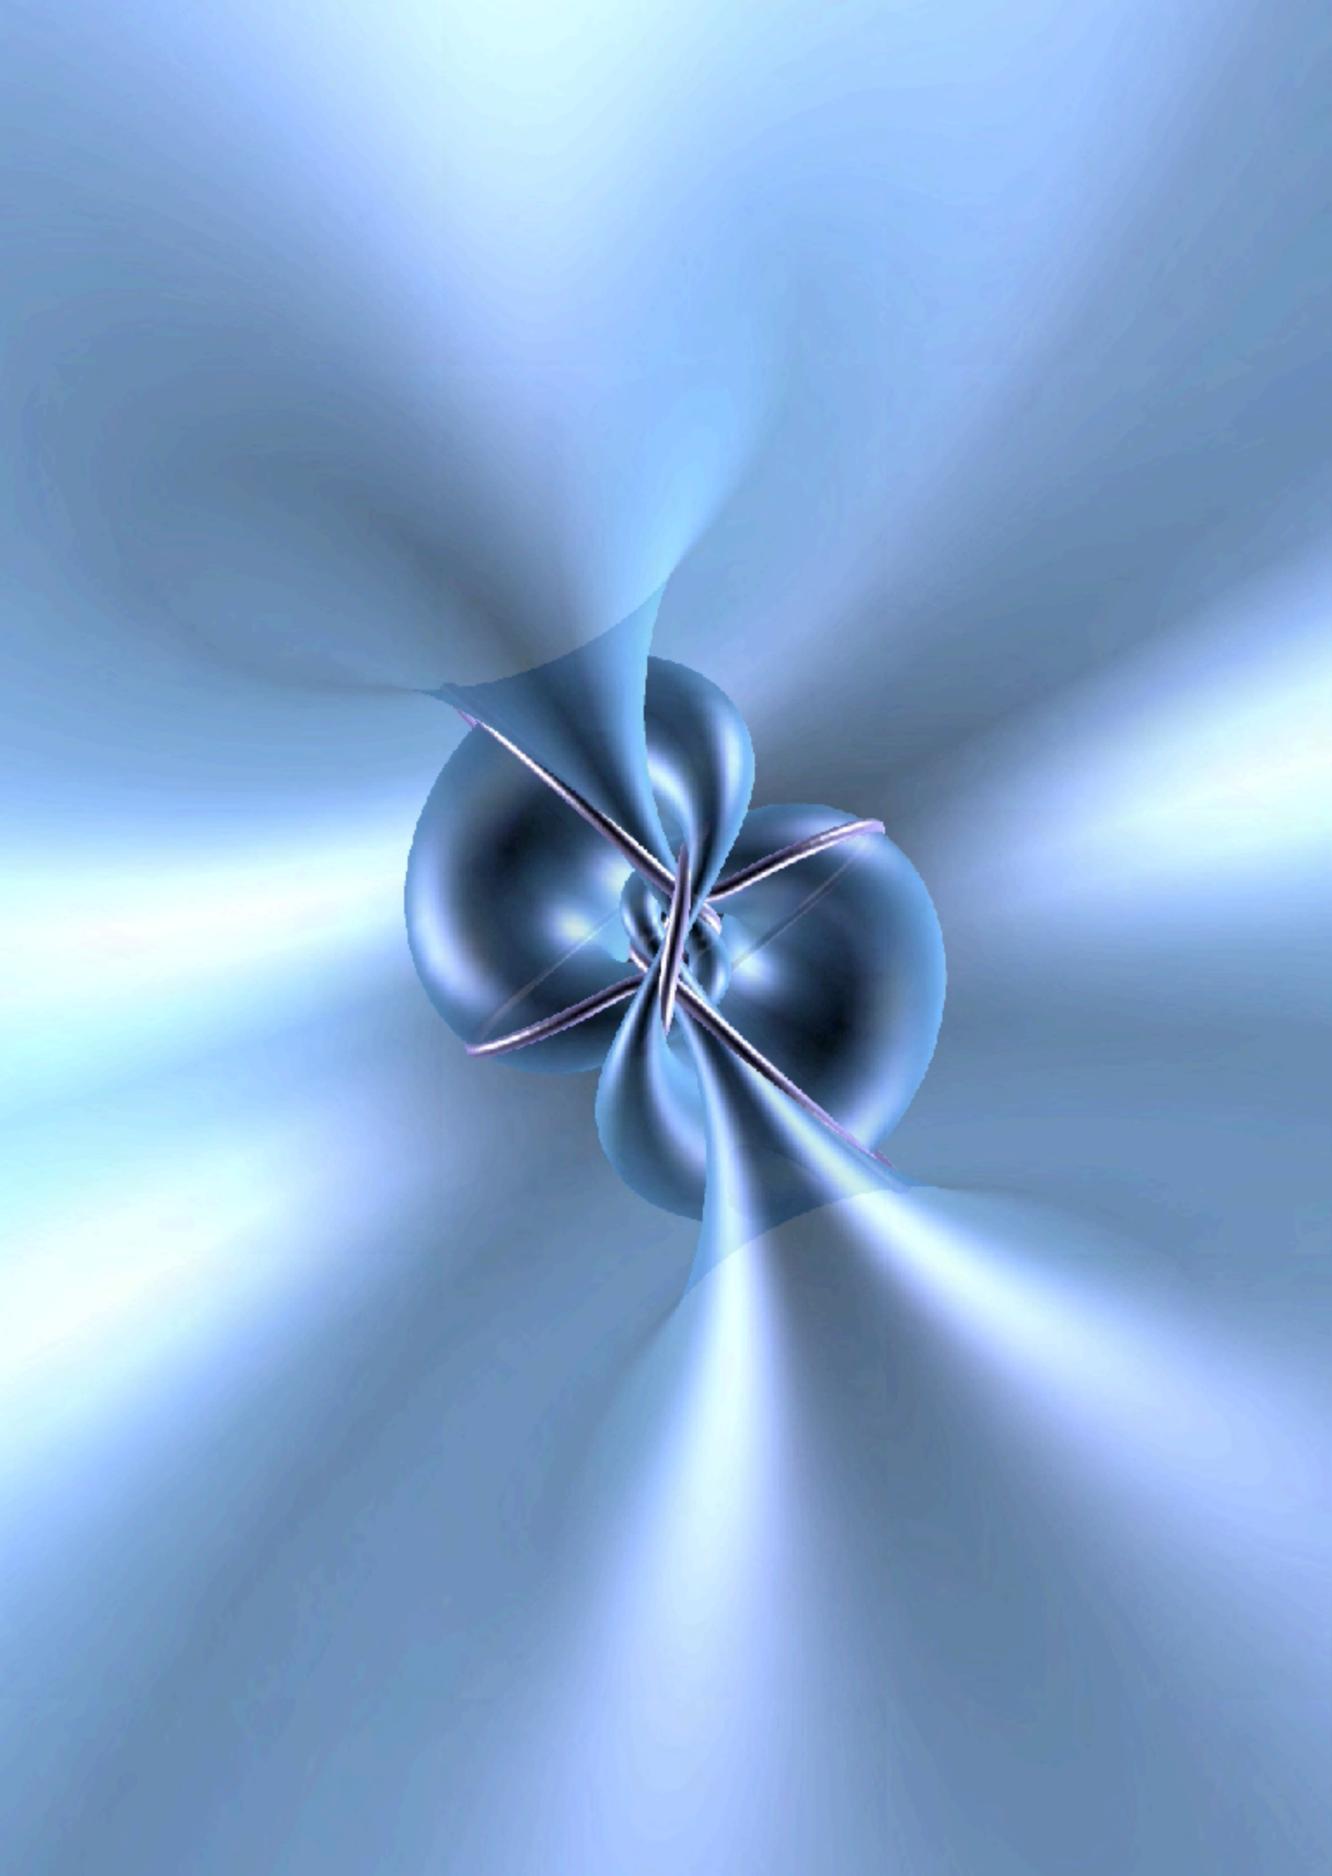

```
>>> M.dehn_fill([ (3,0), (1, -4) ])
>>> M
8^4_1(3,0)(1,-4)(2,3)(1,5)
```

- When there is only one cusp, there's a shortcut

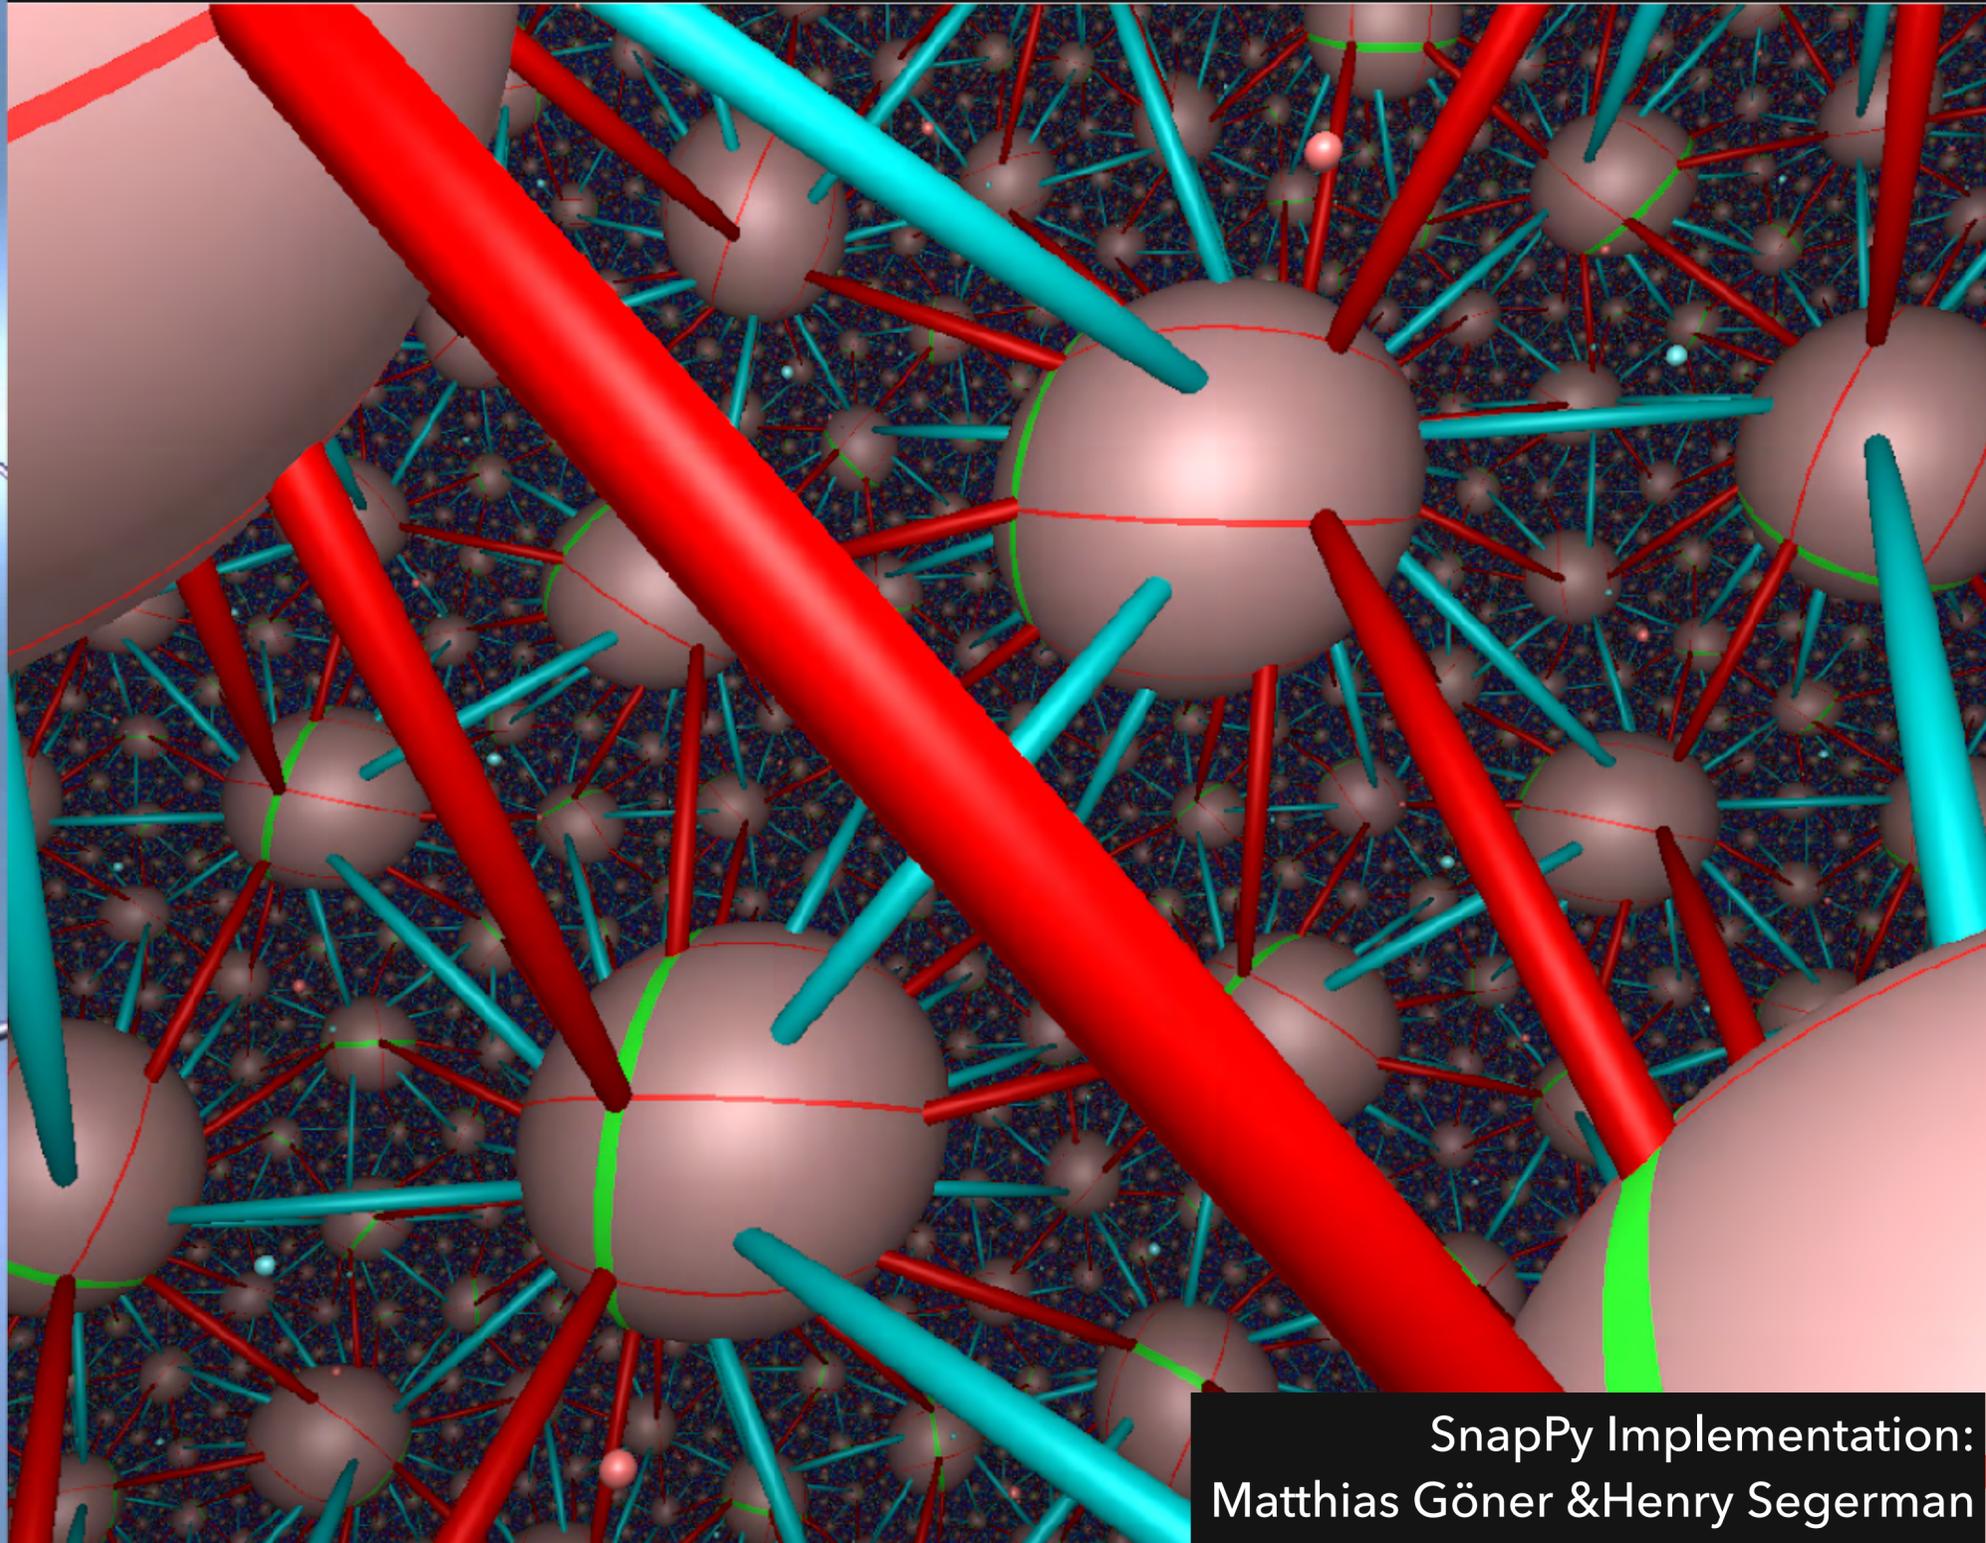

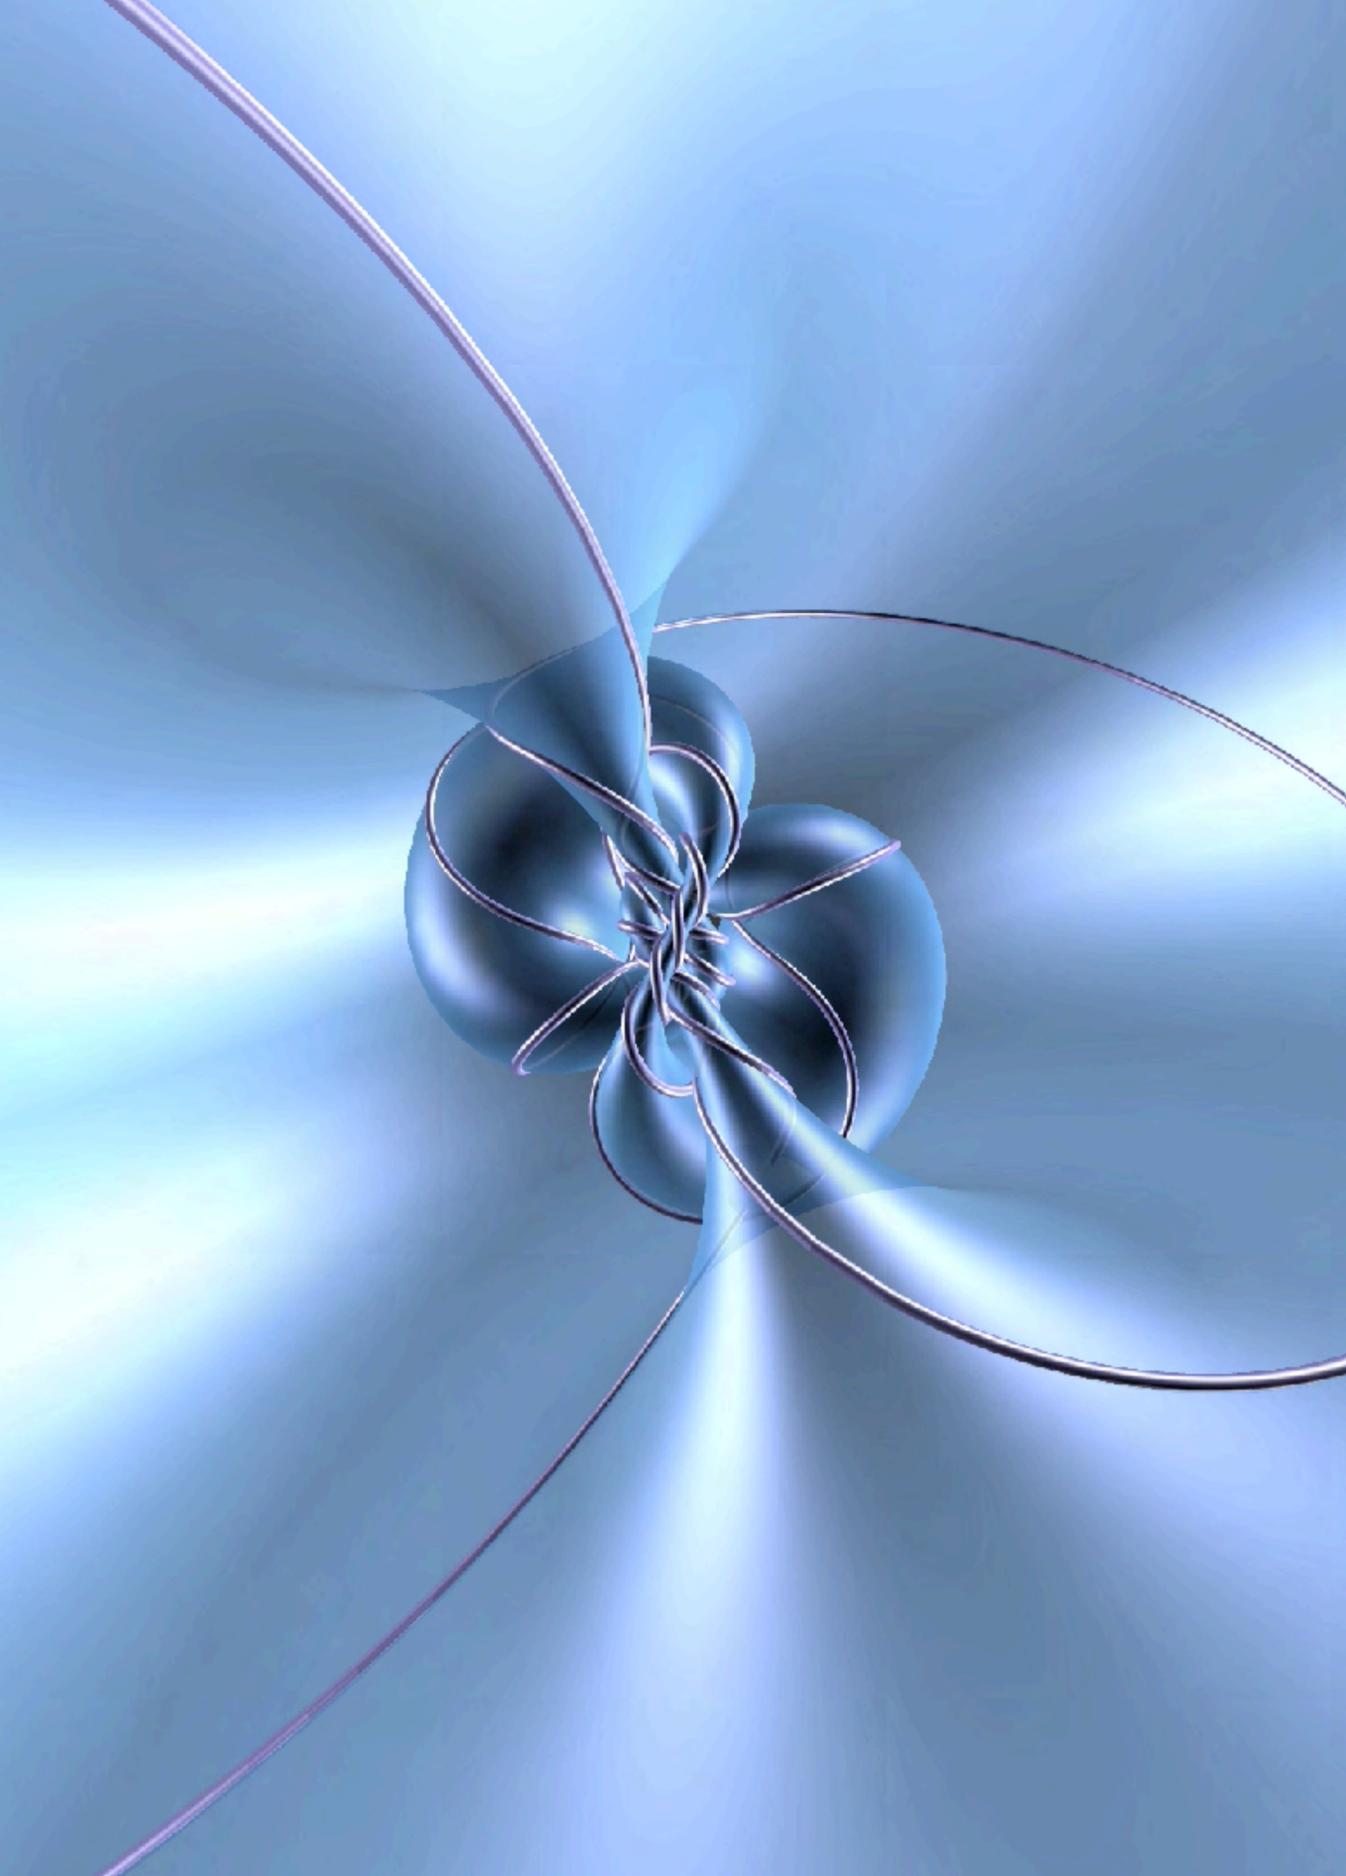

```
>>> N = Manifold('m004')
>>> N.dehn_fill((-3,4) )
>>> N
m004(-3,4)
```

Does not return a new Manifold.

# THURSTON 1980

**For all but finitely many  
exceptional slopes, this results  
in a closed hyperbolic manifold.**

**If the slope curve has length  $2\pi$ , the filling is hyperbolic**

# Idea of the proof:

Dehn fillings are parameterized by pairs of integers = **elements of  $H_1(\partial M, \mathbb{Z})$**

What if instead, we attempted to 'fill' using **elements of  $H_1(\partial M, \mathbb{R})$** ?

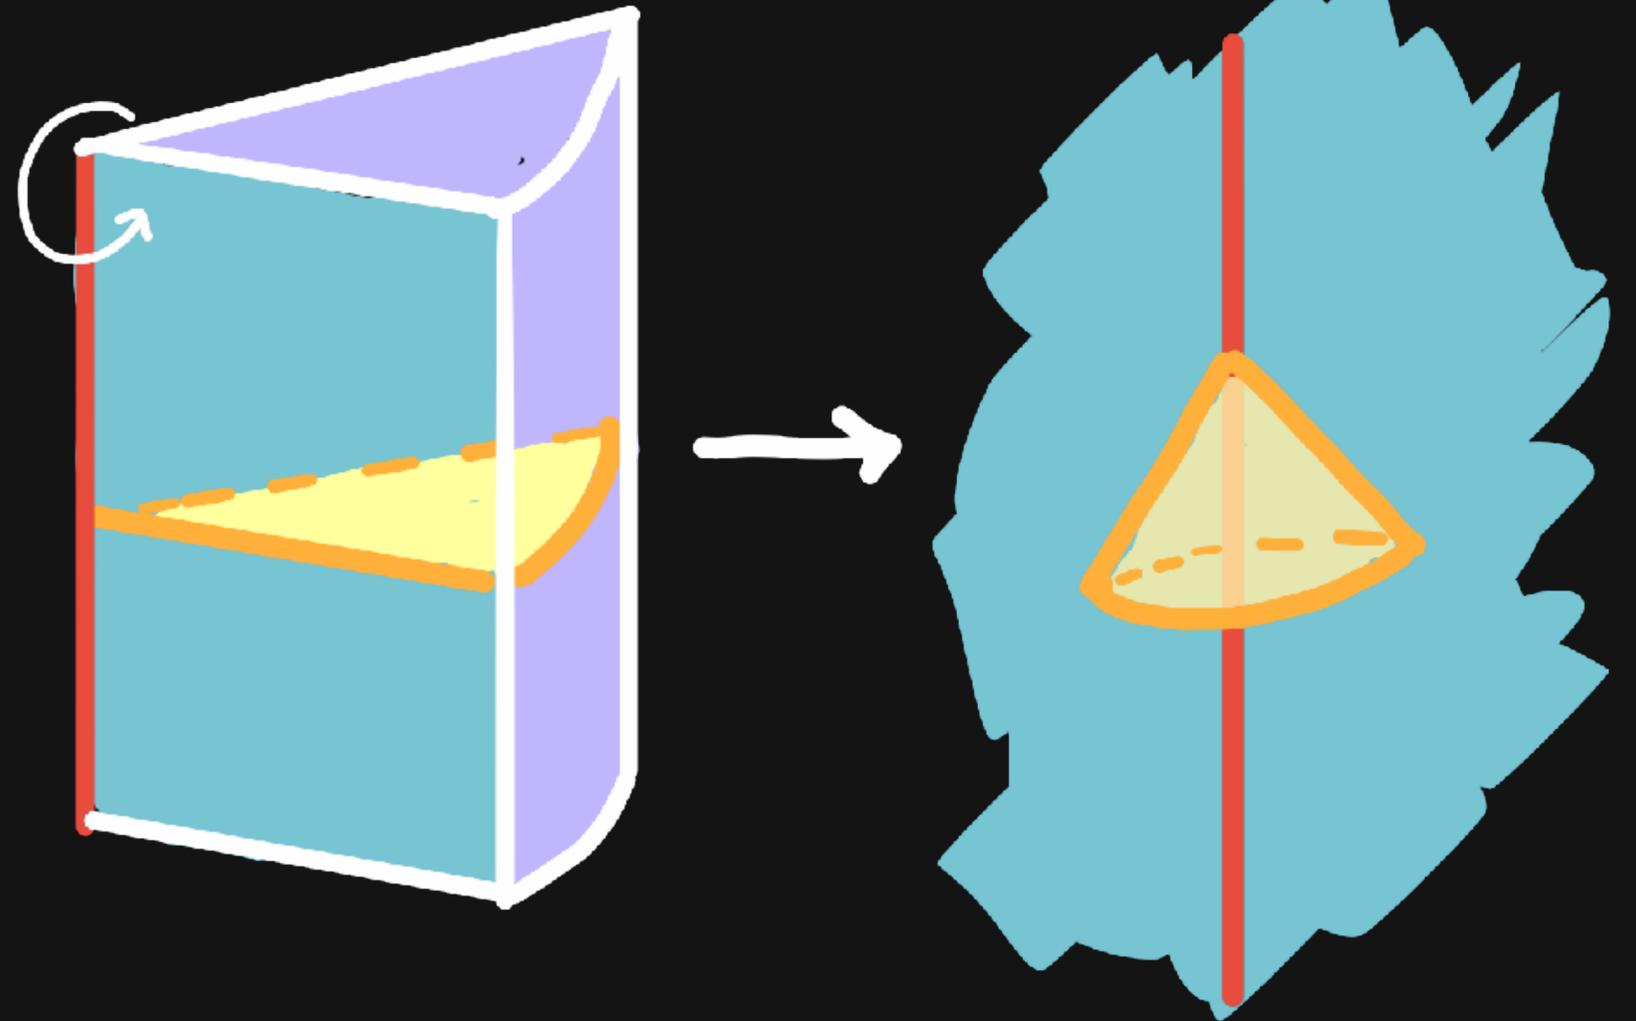

What do these points  
with real number  
coordinates **mean**?

# The result: **cone manifolds**

Like orbifolds with  
arbitrary cone angle.

Complement of singular  
locus is an incomplete  
hyperbolic manifold

Can deform complete  
manifolds to conemanifolds.

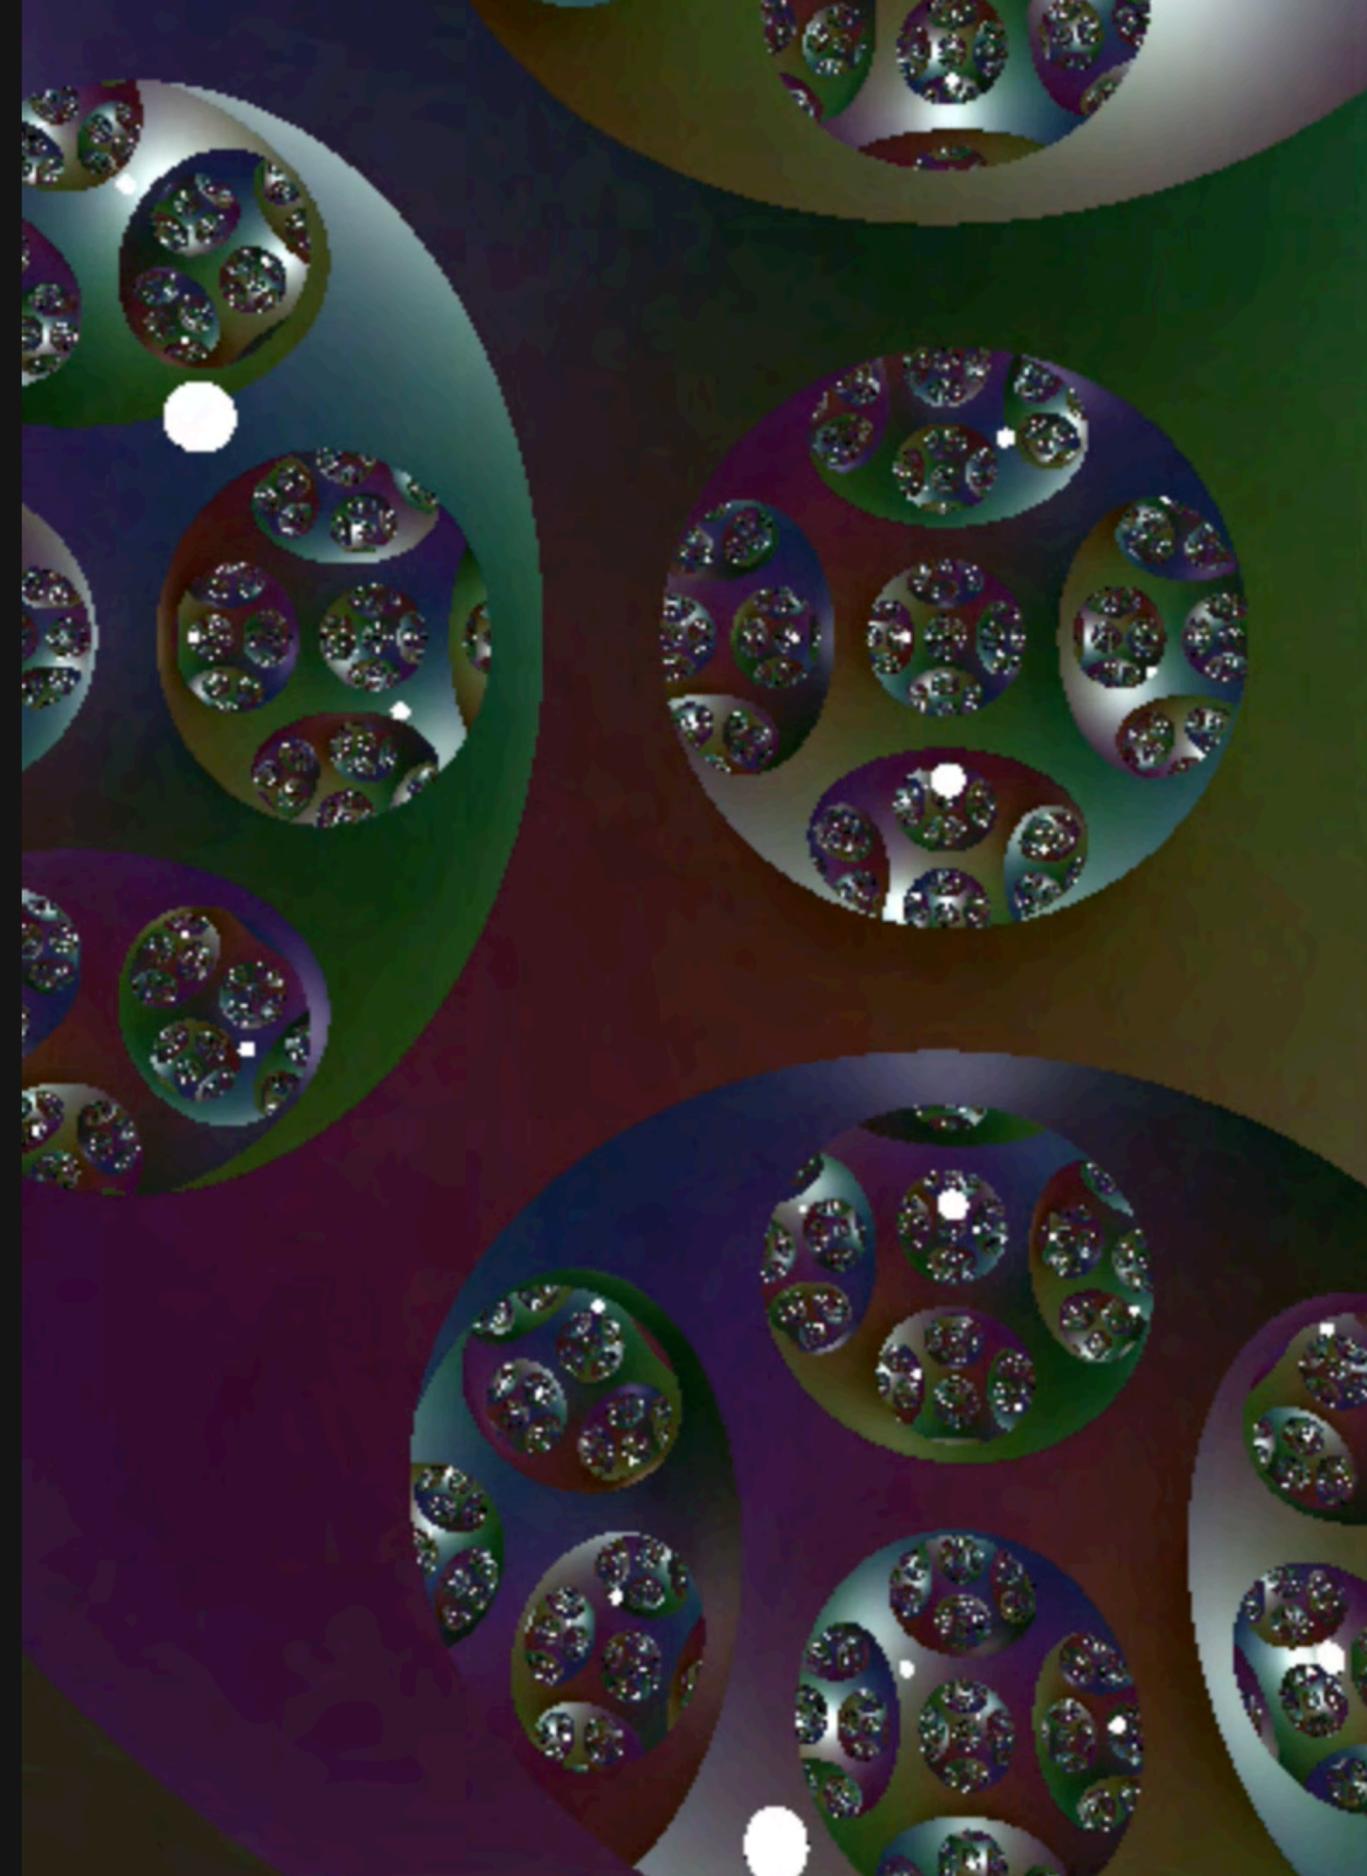

**The result: cone manifolds**

**Like orbifolds with  
arbitrary cone angle.**

**Complement of singular  
locus is an incomplete  
hyperbolic manifold**

**Can deform complete  
manifolds to conemanifolds.**

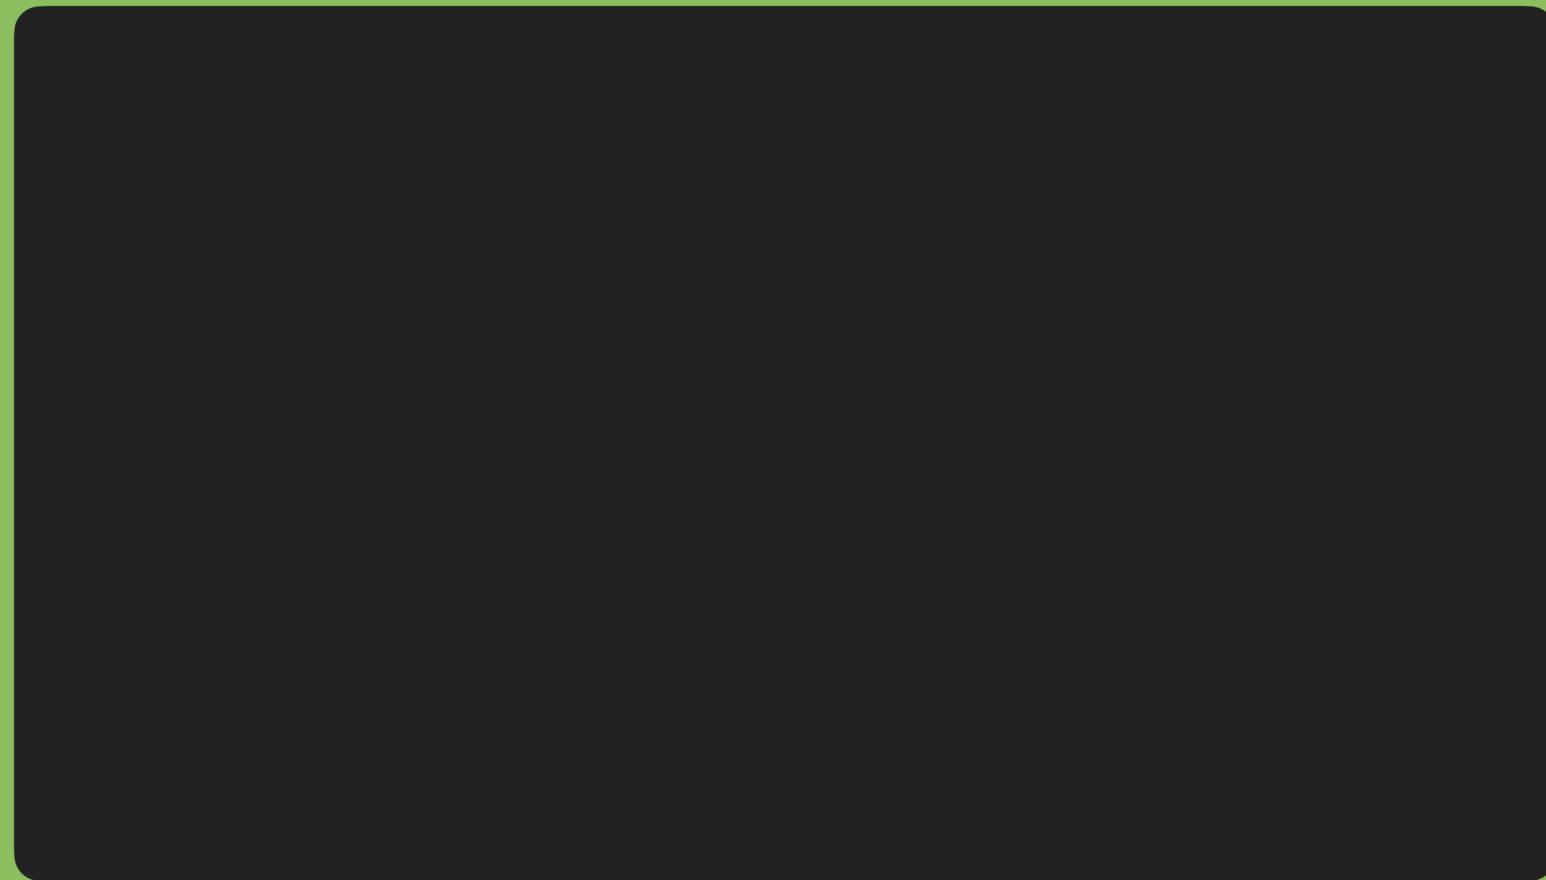

# Hyperbolic Dehn Surgery Space:

**Subset of  $H_1(\partial M, \mathbb{R})$**  corresponding to hyperbolic conemanifold structures on  $M$ .

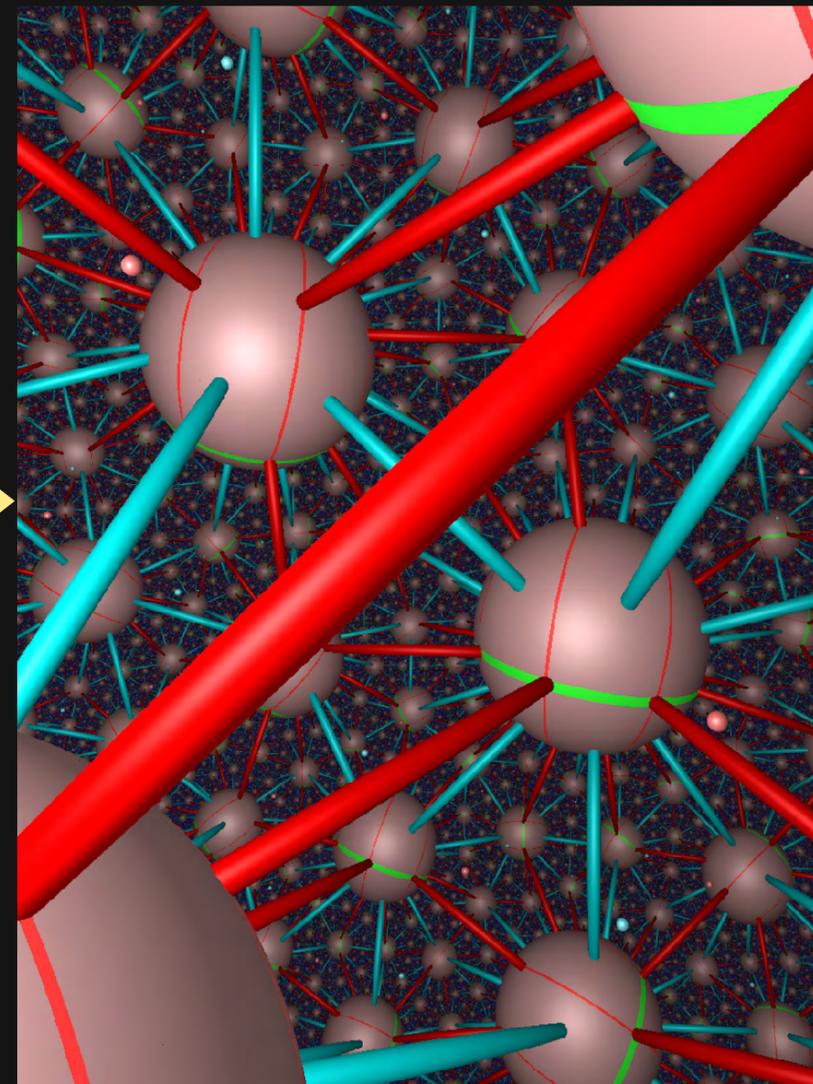

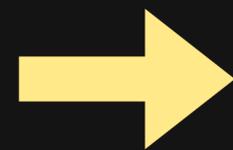

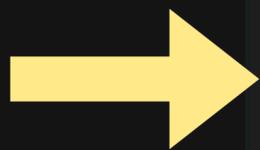

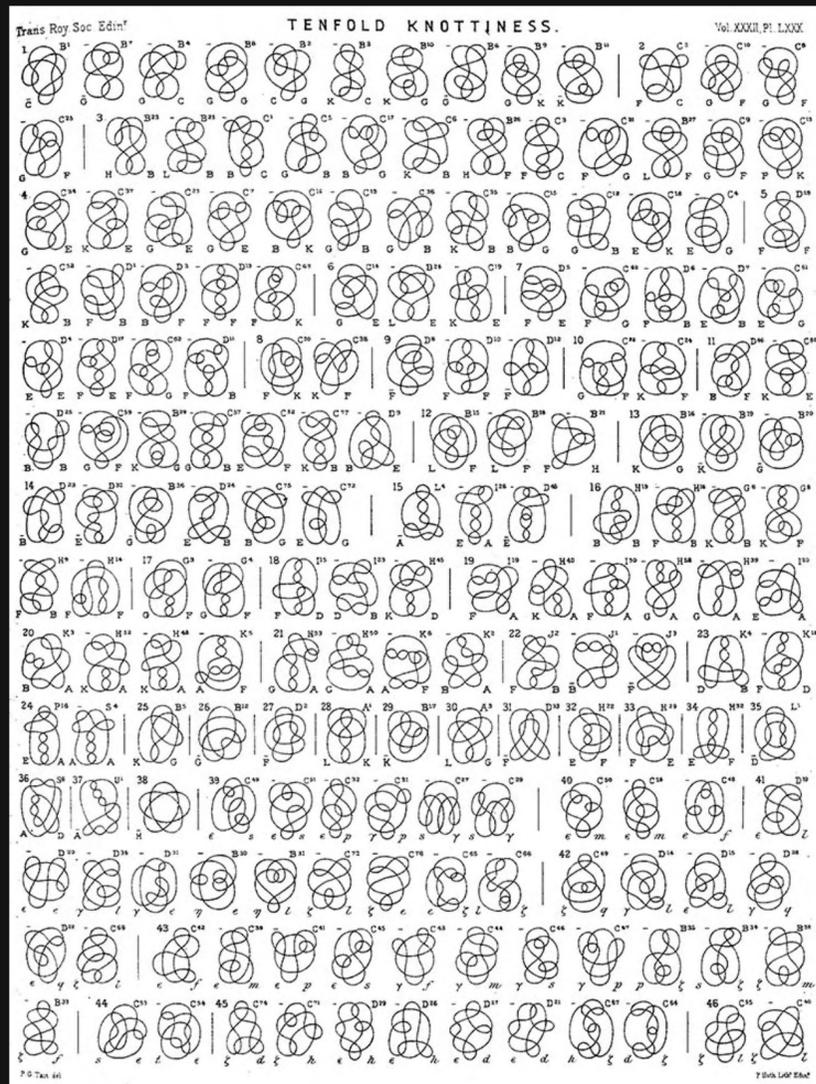

**Theorem:** This contains a neighborhood of infinity.

# TONS of Examples!

Almost any Knot

Almost any Slope

Group with  $\partial \cong \mathbb{S}^2$

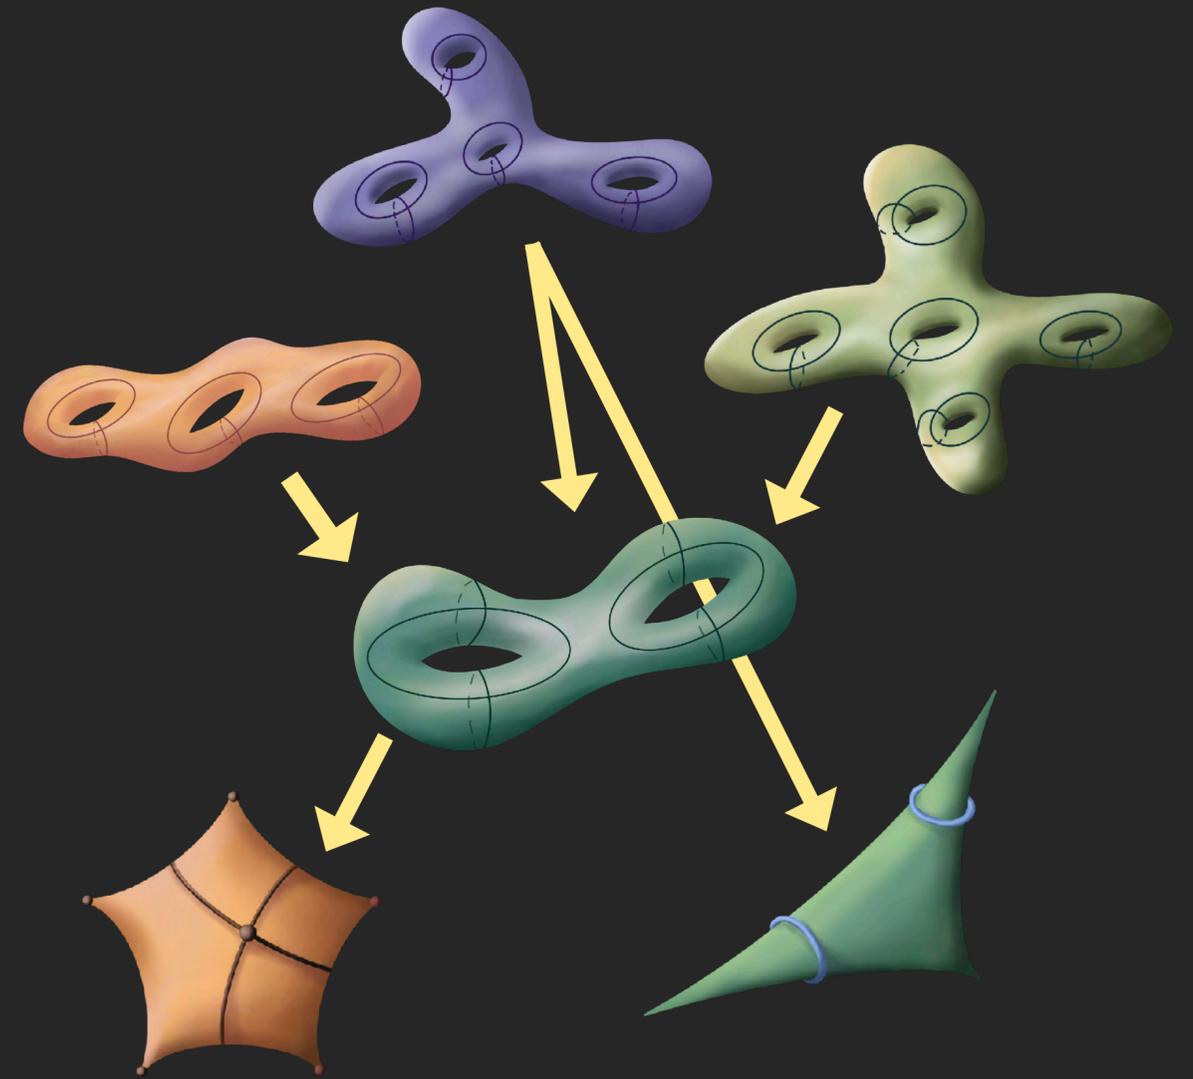

# Explicit Examples!

$$\pi_1 (\mathbb{S}^3 - K_8) \cong \langle a, b, t \mid tat^{-1} = ab, tbt^{-1} = bab \rangle$$

$$G_{p,q} = \left\langle a, b, t \mid \begin{array}{l} tat^{-1} = ab, \\ tbt^{-1} = bab, \\ \lambda^p \mu^q = e \end{array} \right\rangle$$

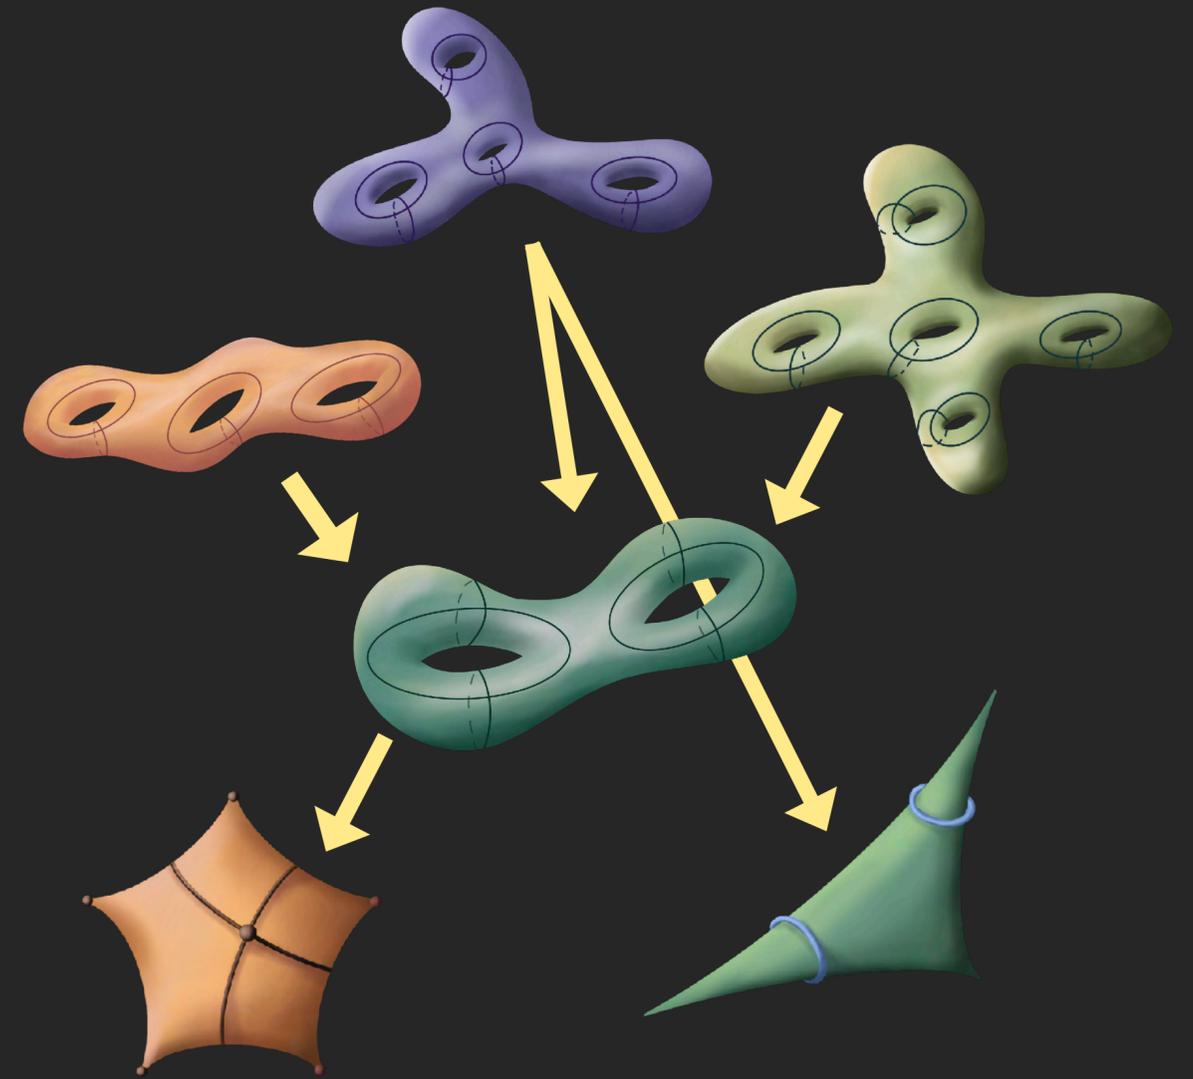

**How different  
are all these  
examples?**

**If two manifolds are commensurable, their volumes are rationally related.**

**What are the volumes of hyperbolic 3-manifolds?**

**If two manifolds are commensurable, their volumes are rationally related.**

**What are the volumes of hyperbolic 3-manifolds?**

# THURSTON

**As  $(p, q) \rightarrow (\infty, \infty)$  the volume of  $(\mathbb{S}^3 \setminus K)_{p/q}$  limits to the volume of  $(\mathbb{S}^3 \setminus K)$**

# Fig 8 and Whitehead link not rationally related.

Thm: Kerhalls 2015

Whitehead Link

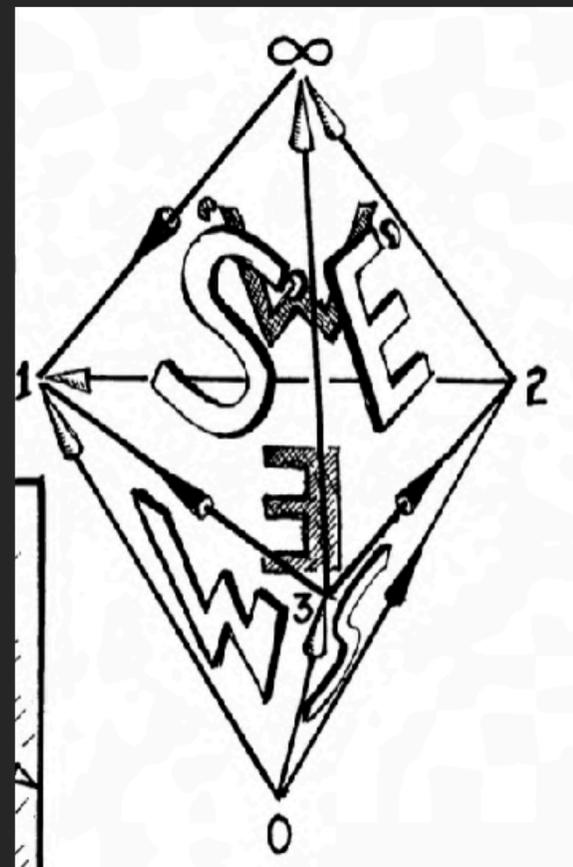

Figure 8 Knot

Volumes are given by summing volumes of hyperbolic tetrahedra.

**Fig 8 and Whitehead link not rationally related.**

**Thm: Kerhalls 2015**

$$V_8 = 3\Lambda\left(\frac{\pi}{3}\right) \quad V_K = 8\Lambda\left(\frac{\pi}{4}\right)$$

**Whitehead Link**

**Figure 8 Knot**

$$\Lambda(\theta) = - \int_0^\theta \log |2 \sin t| dt$$

**Is this all the examples?**

**Do all groups which have boundary homeomorphic to  $\mathbb{S}^2$  come from hyperbolic 3 manifolds?**

**Is this all the examples?**

**Do all groups which have boundary homeomorphic to  $\mathbb{S}^2$  come from hyperbolic 3 manifolds?**

**Open question! (Cannon Conjecture)**

**Extra!!!**

**What else can HDS**

**Teach us?**

**How many slopes are not hyperbolic?**

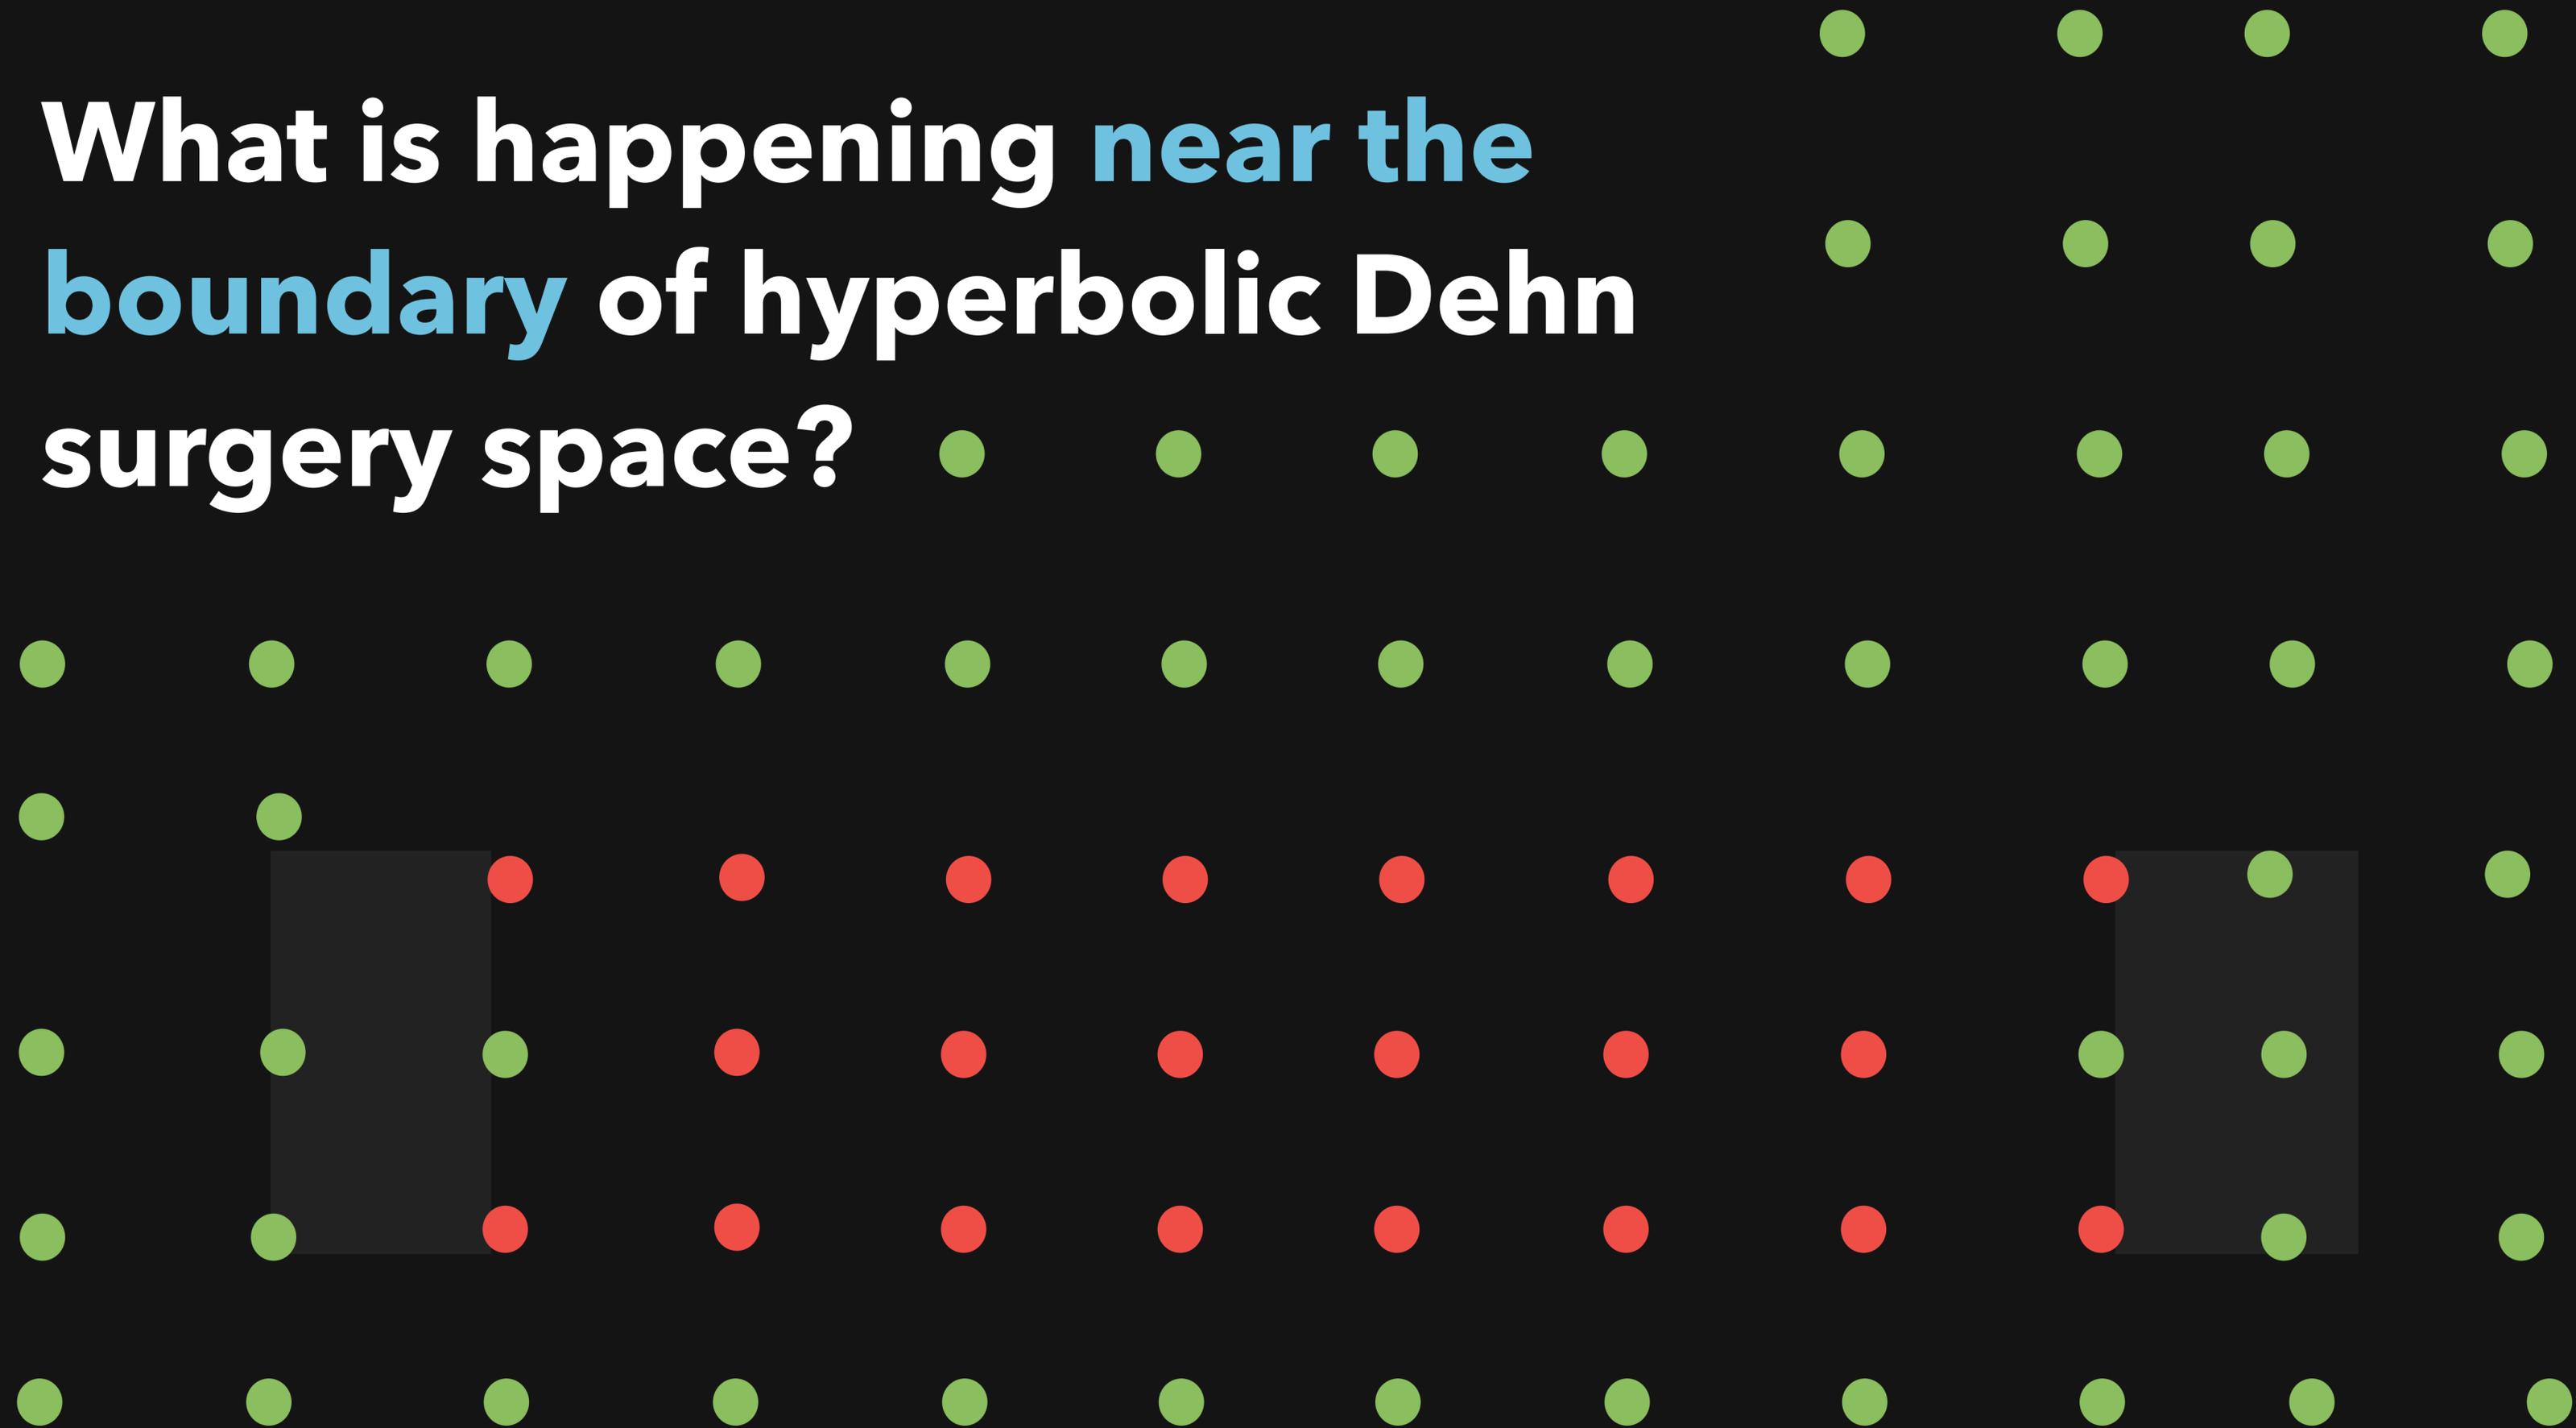

**Fig 8 = 10**

**(-2,3,7) pretzel knot = 7**

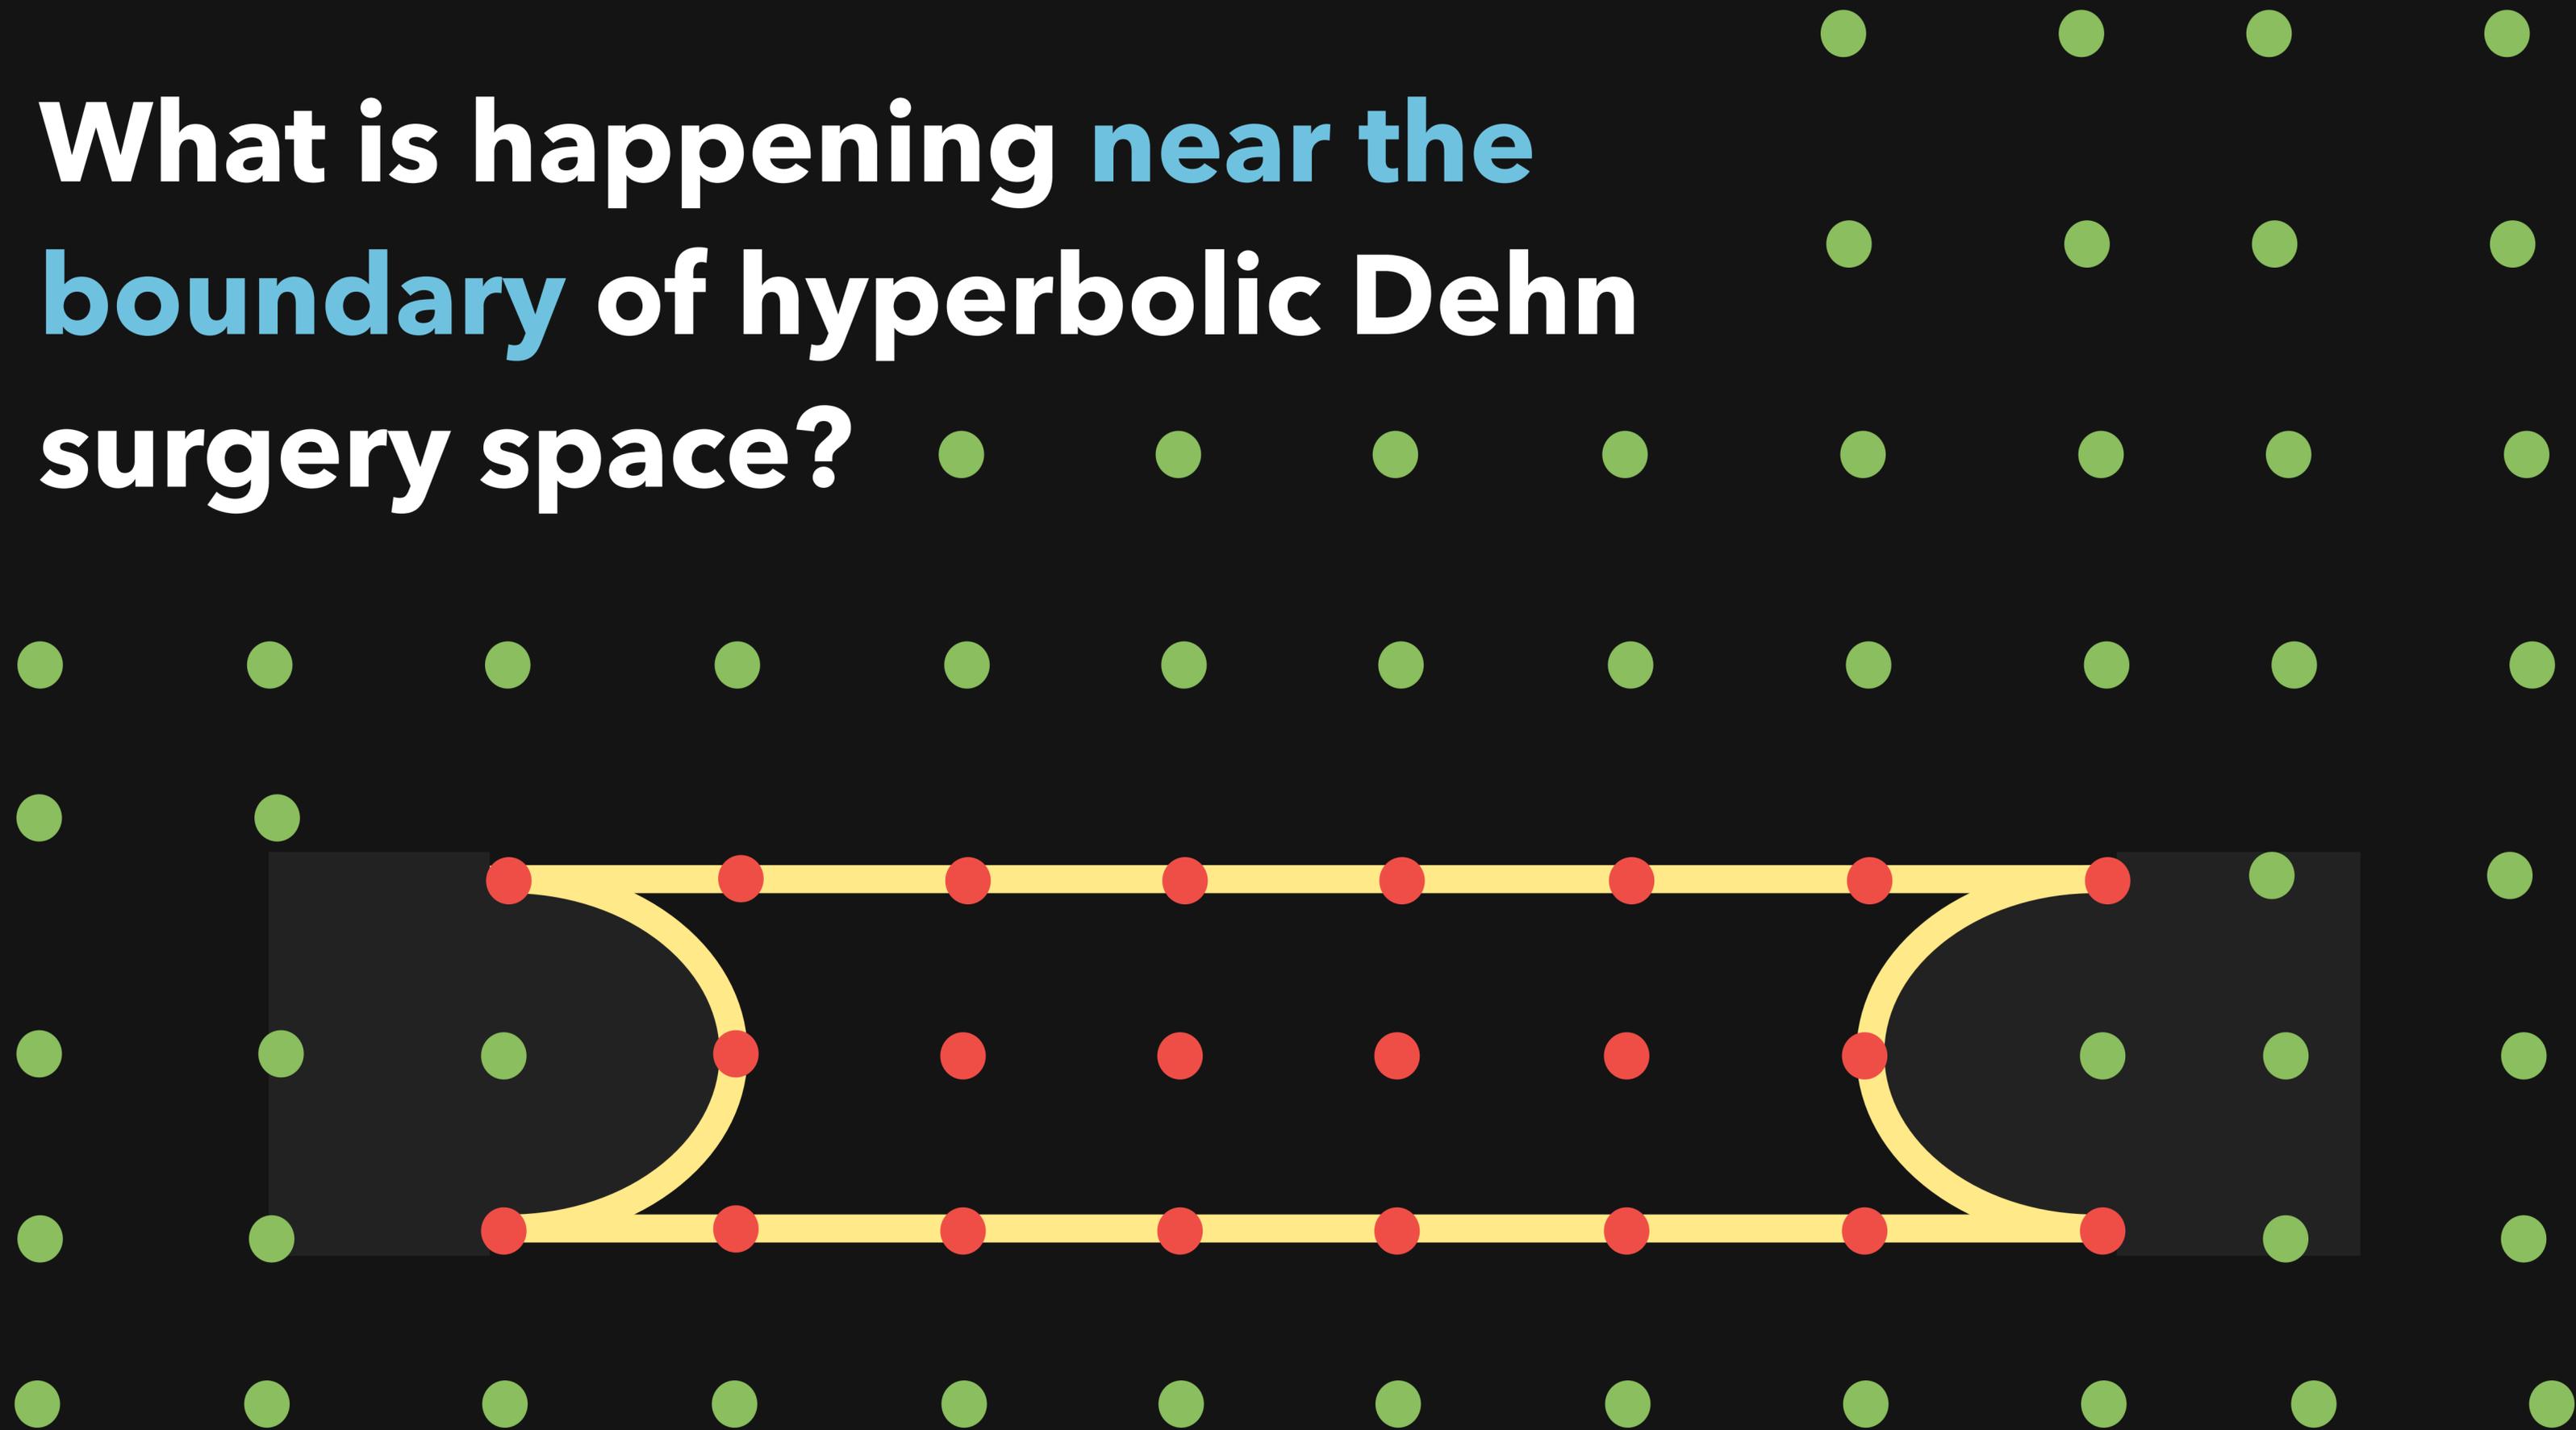

**Conj (Gordon) 10 is max**

**Thm (Lackenby, Meyerhoff) this is true**

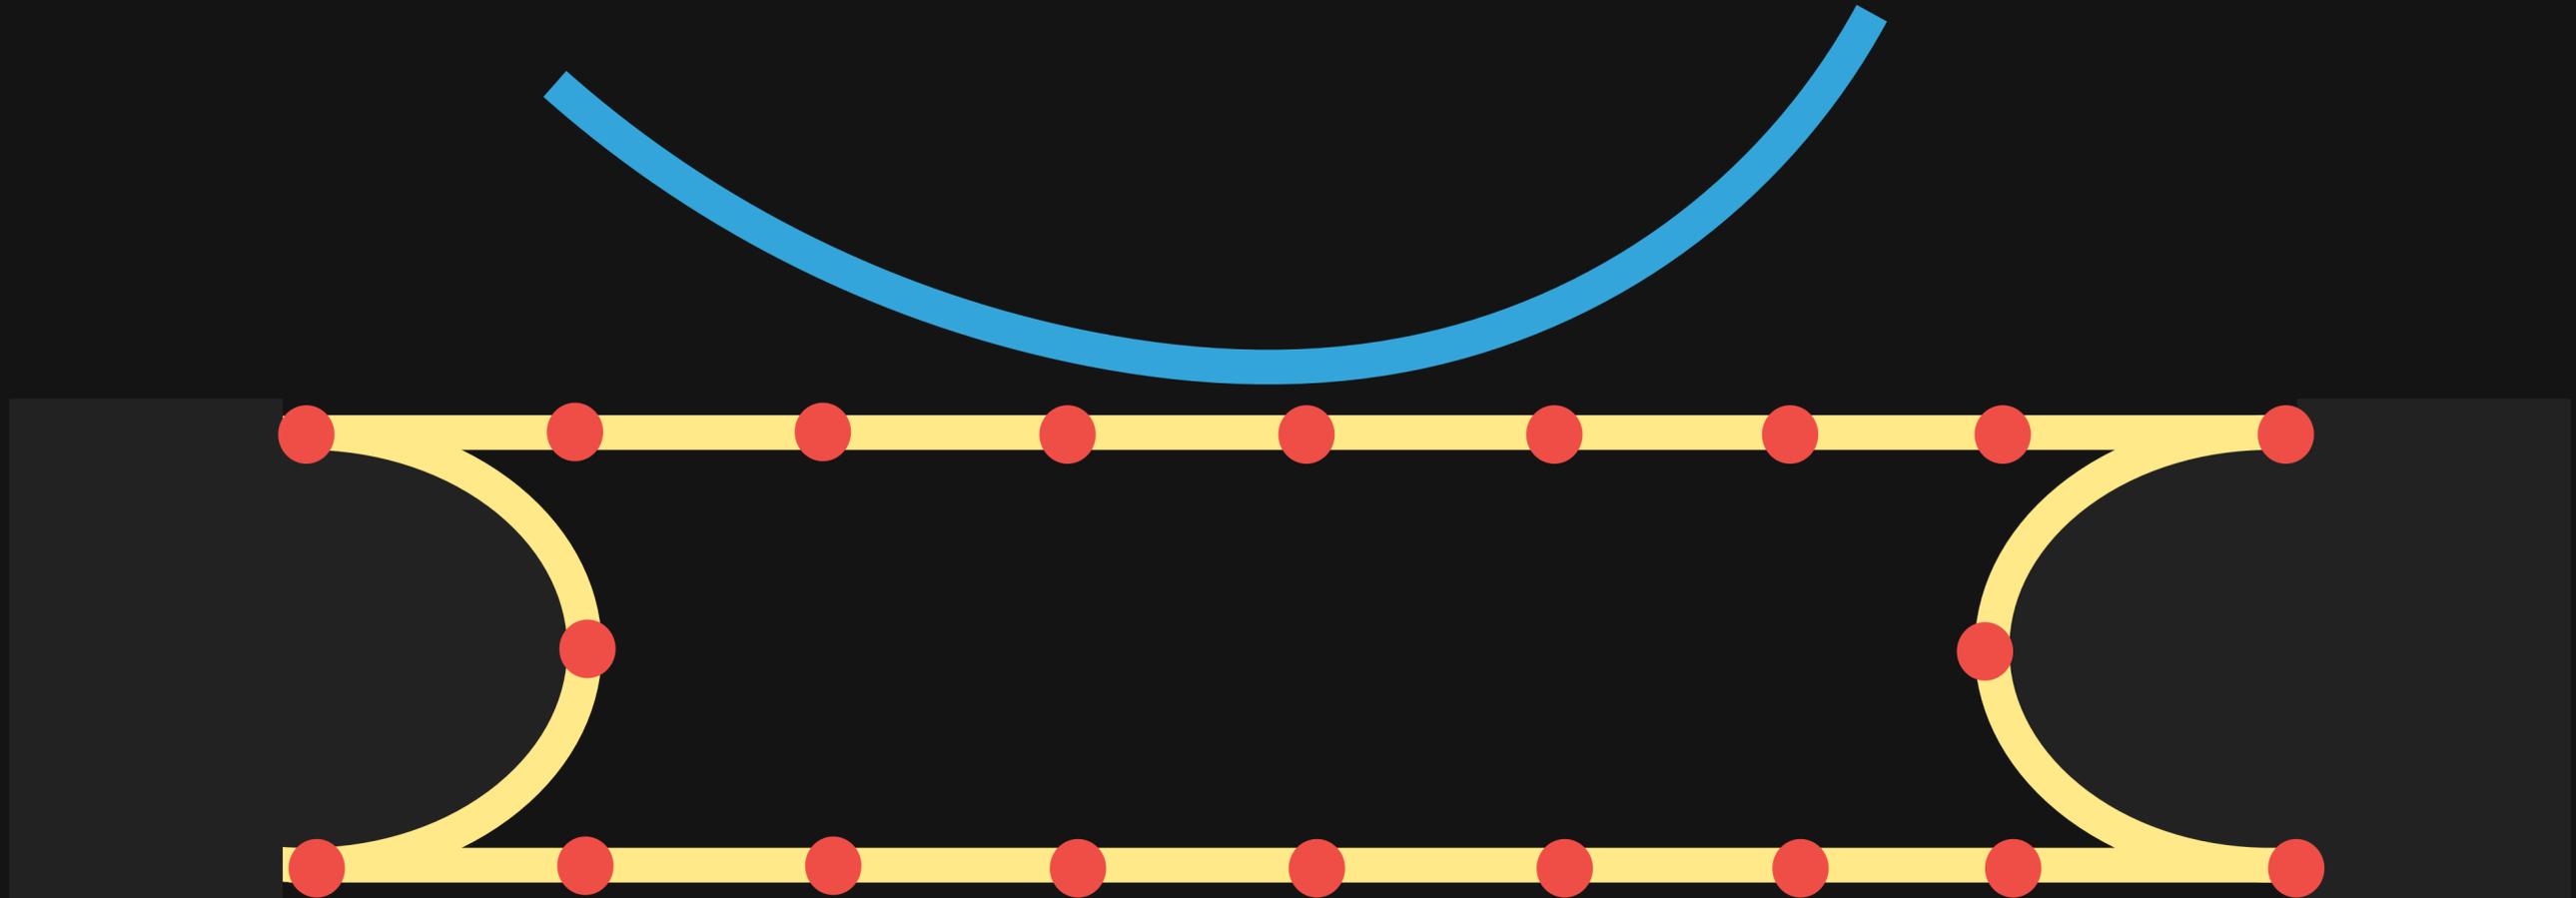

What is happening **near the boundary** of hyperbolic Dehn surgery space?

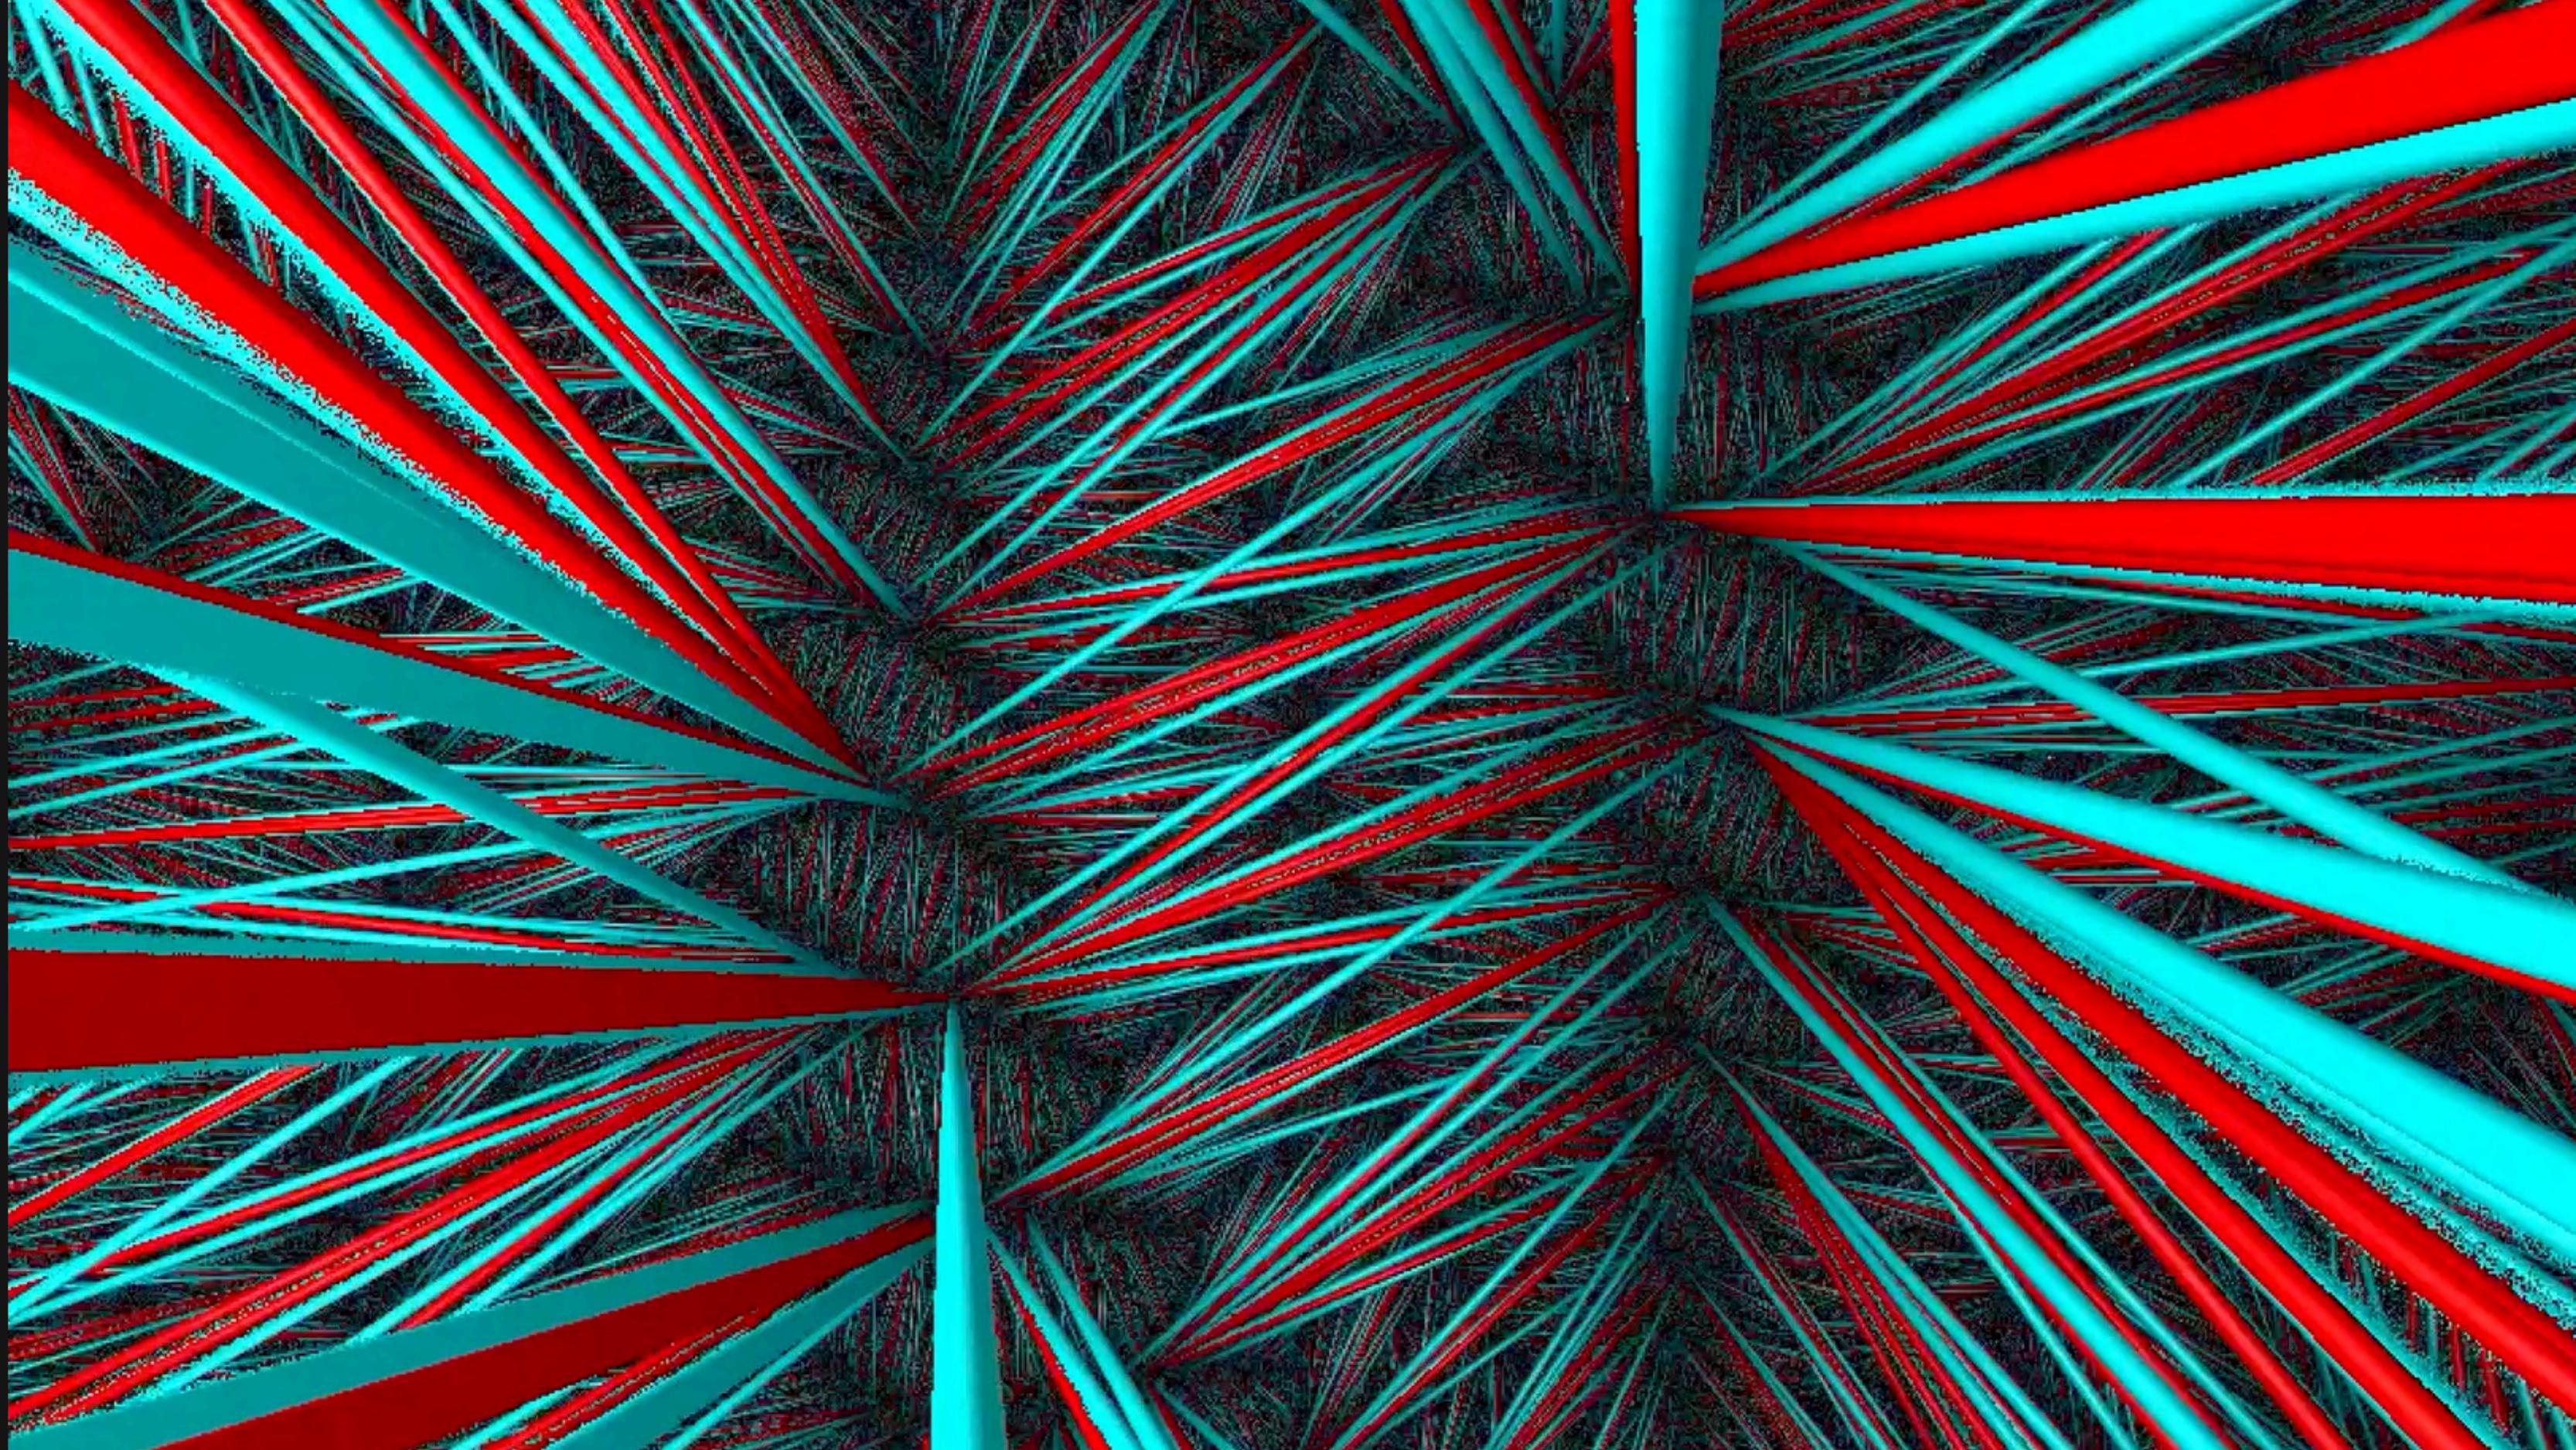

What is happening **near the boundary** of hyperbolic Dehn surgery space?

**Let's look at a path of hyperbolic  
cone manifolds which almost hits  
the boundary...**

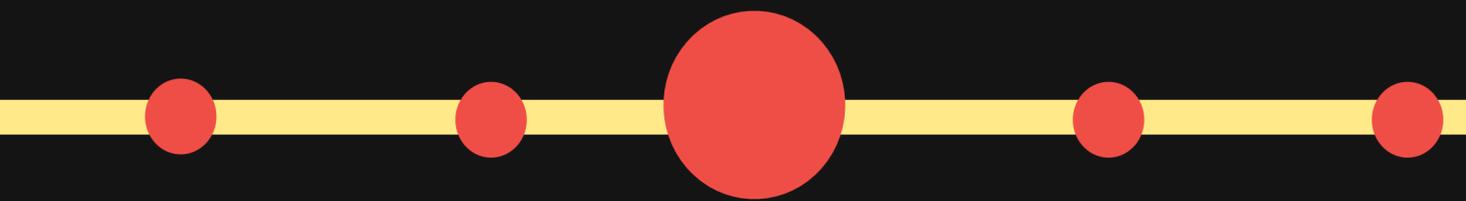

# (0,1) SURGERY ON THE FIGURE 8

**Result has a Sol structure!**

(Torus bundle over the circle  
with  $\begin{pmatrix} 2 & 1 \\ 1 & 1 \end{pmatrix}$  monodromy)

(0,1)

**Theorem (Heusener,  
Porti, Suarez, '01)**

**This structure is the limit of  
collapsing hyperbolic  
cone manifolds.**
